Subject: Howdy Doody Ben!

This is how it works Benny Boy...
You can either stop posting anything related to Bravo Sierra or we can continue
to make a mockery out of everything you post. It's very simple.
When you stop, we will stop. That includes all the retards posting in your
favor. You have various other places to post your useless spam so you determine
what the best way to go is. Stop posting your adverts on the newsgroups or
we just keep causing a tremendous amount of trouble. As you can clearly see,
the atari newsgroup is nothing more than a warzone and we are able to post
as you using your very own topics. Everyone is going off topic and it's because
of YOUR postings!

Simple deal Ben. When you stop, we will stop. Everyone wins the very moment
that you quit posting advertisments. Make no mistake about it, we haven't
been kicked from any emailing service or remailer and we will continue as long
as you continue to post adverts.

We are prepared to stop *right now* so long as you stop posting *right now*.
Upto you. How do you want to play this out?

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.atari.org or at
http://BenSells.atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at atari@aracnet.com or BenSells@atari.org and Please Specify Atari 8 Bit,
ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

```
>> Funny enough, but that's not how it is replayed. The speach engine is really
>> smarter and the sound is not "just sampled".

> I'm sorry, but I have trouble believing this!

> Logically, it makes sense to use a sample rather than try to reproduce
> using synthesis.

Well, take the code and look yourself. (-; The main problem here is the
(back at those times) enourmous memory requirements for "plain" samples.
The speech generation used in Kennedy Approach and GhostBusters ("Electronic
Speech Systems of Berkley" IIRC) did not try to form phonems based on the
formants of the speech, and it didn't try to build up the phonems
algorithmically (which would be an overhelming task back then. The Amiga
software sound did this), but it connected very small samples of around
16 bytes each to form words from basic building blocks. The assembly program
overly run in the pokey interrupts, was quite short and took a minimal
amount of memory, which is IMHO the reason why it has been used.

> Why bother having ALL that code in the program, just to say the
> phrase "Ghost! Bust-ers!!!", for example?

Because it's shorter.

> Sure, samples are big, but if you're only using one, the amount of
> programming work (and, in this case, overhead in space for the synthesis
> code, since it's only used for this specific purpose: one sample) makes
> no sense.

Well, as said: Take a disassembler and check yourself.

Greetings,
Thomas
```

6356. ATR files (wrong density detected)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-18 10:20:07 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <araesvhbf1@nets3.rz.RWTH-Aachen.DE>
Source record: 25877

Howdy folks

I downloaded a lot of demo files from the internet, mainly from Sven Gleich's page.

I'm impressed with a lot of these demos (and am not so impressed by others). But it seems like DISKFORMER by Ken Siders sometimes isn't able to detect the right density. Matter of fact, it doesn't even ask me for a density but selects something other then double density.

I've check these files. They all start with a row of six numbers from which I guess numbers 5 and 6 are the number of bytes per sector. Some say 80 00, which would be 128 bytes per sector, others say 00 01, which would be 256 bytes per sector. So I guess that's correct.

Does this happen with other ATR to Atari disk utilities too?

CU Mathy van Nisselroy

PS I'm otherwise very happy with DISKFORMER. Although a dirctory option would be nice. I keep forgetting how a filename is spelled.
PPS has anybody come up with a fix for this?

This has gone far enough. You don't have to like Ben's ads or posting from other people, but threatening people? Come on. Grow up.

CU Mathy van Nisselroy

PS anybody know how to find where this wimp is hidding. Let's tell his mom about him, so he'll be grounded for a year.

6359. BUG: Atari800WinPLus 5200 emulation

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-18 13:25:20 UTC
From: dnsdebro@netzero.net
Message-ID: <adf9eca9.0211180525.32003bd6@posting.google.com>
Source record: 25880

I posted this on the AtariAge message board a while ago not knowing I should have reported it here (as stated in the readme.1st file).

In 5200 emulation mode, if you use the upper fire button for a game that disables the VBREAK and has no VBREAK routine defined, the game could crash. Give it a try with Super Pacman. It disables the VBREAK (setting bit 7 of IRQEN low). If you press the upper fire button (usually the shift key) and press a value on the keypad...CRASH.

I tried to report the error to the author (the e-mail address in the about box) but the message bounced.

Here you can verify what you assume:
http://www2.asw.cz/~kubecj/afmtatr.htm or
http://www.atarimax.com/ape/docs/DiskImageFAQ/

I hope the diskimages are correct. About a fix for Diskformer I don't
know.

Sven.

6361. Still have lots of Crossbow carts for homebrewn/new XE games

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-18 13:38:43 UTC
From: 0266140338@t-online.de
Message-ID: <9947bb30.0211180538.13be7c8@posting.google.com>
Source record: 25882

Hi,

I still have 100+ Crossbow carts , if anyone has programmed an interesting game or another program , it should be possible to create a cart-version of this one.

Crossbow is a 128K XE cart , it should be possible to use at least 128K , maybe more.

Problems with XE carts (use some space in ATARIï¿½s memory,cannot be switched off)have been discussed in several threads and programmers have to keep this in mind.
One advantage of carts is , that , for a game , you donï¿½t have to care about DOS and have more memory.

I have the carts , we would still need EPROMs and maybe a professional package/manual.

I think we may produce 100 of a game with package (non-games wonï¿½t need package , I think) and sell them/offer them via the ABBUC in Europe , maybe via ATARIAGE in the US.(100 games for Europe / 100 for USA).

I donï¿½t want to make big money from it , Crossbow carts are almost worthless with the game Crossbow , and it would be nice to have a new ATARI 2600 game on cart.

Did work with ATARI 2600 and 7800 games , you may know , and itï¿½s even possible to port ATARI XE games to the 5200 (which wasnï¿½t released in Europe) , although you may have to remove some graphics etc. because of ATARI 5200ï¿½s memory.

I also have lots of ATARI 2600 games which already are on EPROMs.Most of them 8K.

Thimo

Hi all,

up until now, I have been looking a bit bemusedly on the whole discussion about Ben's adverts. The solution which seems to be reached (the ADV: in the advert headers) seems to be satisfying the majority of regulars here by making the posts even easier to ignore.

For me, sometimes I view them, and sometimes I ignore them; the Bravo Sierra sender is indication enough for me.

This latest message to Ben, however, shows that some individuals do not know where to draw the line of what is viewed as 'acceptable behaviour' by most people.

It seems like these days, if someone seems something (s)he doesn't like it isn't sufficient to simply ignore it.
No - it has to be stamped out, deleted, eradicated and the individual responsible threatened or cowed into submission, at any price. * Sigh *

In this case, some sad git has seen fit to threaten Ben, which I think is completely over the top in relation to his alleged wrongdoings. Moreover, I suspect the one responsible knows that his/her actions are not acceptable, hence the fact that the message has been sent anonymously.

I think that if someone is truly offended and takes appropriate measures, they should be doing so in public, or at least under their own name. To do it like this is far more despicable as anything Ben seems to have done. Furthermore, I haven't seen any indication that Ben responds to dissenters with threats or somesuch... He doesn't seem dangerous to me.

Well, I could go on for a few more paragraphs in this manner, but I think I got my point across now without too much namecalling. Feel free to disagree, I'd say, and let me know what you think.

To Ben I'd like to say: I think that a lot of people on both sides of the argument don't agree with the practices shown in the message to you.

On a more personal note: my dealings with Ben have always been pleasant and he seems to me like an honest man, even telling me about customers who are or were not satisfied with his service. He has my support !

To the sender-of-threats I'd like to say: who appointed you as defender of the content of csa8 ? And why do you think you can speak for us all ?

Kind regards to all,
Wef Dinaini

PS: Yeah, I know the return address on this message bounces, so I'm also posting anonymously, in a way. A number of regulars here (waves to Fox & Mathy) know who I am, however.

I don't remember who it was, but at first the person
complained with a name. That might tell who is
harassing Ben. At least Ben's ISP has said Ben
can continue his ads. I don't pay much attention
to Ben's, or Dean Garrahty (sp wrong), actually, as
I'm not looking for anything right now. I appreciate
Ben telling the group about this, and I hope it
clears up and the harasser quits.
I'm one of the 'retards' that support Ben's reasonable
and on topic posts about 8-bit stuff. If he was selling
ST or some other off topic stuff, that would be different.
Ben is a contributor and participant, which is important
to me. (Well, he also sells ST stuff.)
The 'we' in the threat message isn't a 'we', it is a 'me'
only one person can send an e-mail.
Rambling Russg

Cheers Sean, many still write bits (Bill Kendrick etc) and others
make / play with new hobby hardware which is fantastic. I just test
and add the odd idea or three like many others in here.

Also a mention must go to the retailers like Lance, Ben, Best and all
the others that keep the 'real' stuff going.

As for my love (the emulators) there's some crackers on all the
systems and while not 100% perfect they do offer a very good avenue to
the hardware-less folk.

Try CCS64 or WinVice for the C64, both work very well.

The sender of these anonymous hate postings and e-mails to Ben, AKA "Bravo Sierra Computers" does indicate the individual has sociopath tendencies and though carries a tone of threat in the messages is more than likely too cowardly to act upon serious action. I would guess the individual has few friends. S/he (more than likely a guy 22 to 24 in age but there are pointers in the messages that there is a deep desire to be a woman). And though an adult in years is childish in inter-personal skills. S/he uses this form of annoyance to gain attention. Somewhat like an only, lonely child. We would better serve the individual with pitty rather than anger for "Percy" is in need of help.

I've nick-named the individual "Percy from the Green Mile". Seems fitting.

An interesting subject. I hope to get an "A" in my Sociology course.

I have one called Centipede (not the Atari one) when the word Centipede is laid out down the screen in different colour ball shaped sprites (ala in a long centipede shape)

It's a very good Centipede clone..is that it?

>He has my support !

Hi all

I've had dealings with Ben in the past and as far as trading with Ben I have no problems and will more than likely trade again with Ben in the future.

I've always stated that, it's just the overdoing on the advert posting front that's a tad annoying.

I tend to read, again, posts that are for selling, wanted or trading/swapping (amongst others) and it does get a little repetitive if you are reading several postings with the SAME content but different subject.

I dont believe in threatening people, if it was the posting that was annoying! Make a comment about your displeasure and get on with your life (if you have one).

There isn't enough spare power inside the 1200XL to run a HDD - a CompactFlash card, yes. A disk drive, no. You can replace the power-hungry dynamic RAM with static ram - that will free up one of the regulators for your HDD. It is a little bit of work, though. So is the HDD, I guess. I usually pull the heat sink and regulators and use an external supply. You get more room to put stuffthis way.

Hi People, and specially Aaron,

I already downloaded your entire site, even before knowing it was shutting down :(. I used HTTrack (a web spider) to grab all htm pages. I hope you don't mind this abuse of bandwidth ;). Then I created a perl script to extract all .zip links from those pages. Finally, I imported this list into GetRight, which got all the files into my HDD.

As long as your archive is only composed of .zip's, I think I got it all. Anyway, it would be nice to save the whole website, maybe with some free web account and link the zip's to some ftp with enough space. What do you think, people?

Raul

P.S.: Your documentation section seems to point to the games. Did you ever put in any manuals / walkthroughs?

Hi Steve,

> I've always stated that, it's just the overdoing on the advert
>posting front that's a tad annoying.

Quite, that was my view too.

I kept out of the recent arguments about this though (what's the point, after all, doesn't your newsreader software offer filtering facilities?) and I thought that the compromise that was reached was a very good one.

Everyone seemed happy with the situation. So *WHY* has all this kicked off again now?

Personally, and without pointing any fingers, I think that those individuals who started posting Bens' advert for him need to take a large share of responsibility for this....considering how emotionally charged an issue this seems to be, the *ONLY* possible result of doing such a thing would be to stir everything up again. Which seems to be exactly what has happened! :-(

Thanks guys.

Now, can we PLEASE leave Ben alone to do his thing (and let him post his own adverts, he doesn't need our help).

> I dont believe in threatening people, if it was the posting that
>was annoying! Make a comment about your displeasure and get on with
>your life (if you have one).

Absolutely, that is COMPLETELY out of order. Obviously the child has nothing better to do.

TTFN - Pete.

Well, call me biased, but having heard both, C64 and the Atari version of the tune, I prefer the Atari version of the tune. I really like the "clicking" percussion. The same goes for Rob Hubbard's Jet Set Willy.

The same music is actually on the Red Max Atari version main screen,
some of the versions around start mid game so you won't hear it.

As for the versions, I've heard some Hubbard stuff that beats the C64
version but mainly I edge towards the filters on the C64.

But not always..

>
> But not always..

The same here. The 64's SID is an amazing piece of hardware. I wonder how
often I've loaded some C64 games just for the music. Rob Hubbard is my
all-time favourite computer musician. It's a shame he didn't do the Atari
version of "Thrust". On the other hand, the C64 freaks have been deprived of
an Atari-only Hubbard tune, which of course is Jet Set Willy.

How to say it? Probably 'No'? <g>

In fact, 800XE was most common computer in our area. 65XE was completely
the same here. Both have ECI, some have 130XE motherboard without EMMU &
64KB of extended ram.

I guess many people here know that I don't have Atari hardware for several years now, and I do all my 8-bitting in emulation. (If you didn't know it, you just found out <G!>) But if circumstances were different and I still had my hardware, I'd be happy for any reference to retail sources of hardware and/or software for my Atari no matter if it happened to be an advert submitted by the retailer, a reference made by another poster, or something in snail-mail. It's getting pretty tough to find anything Atari these days unless you're "in the know."

So, my advice can be summed up in three words:

PLAY NICE, CHILDREN!

Take care.

I emailed Tom Hunt and asked him if he wouldn't mind putting your
files up on spudster.org and here is what he said:

<SNIP>
The CTH archive is hosted on an FTP server. I don't think he'd go for
it because he likes the fancy web pages to display the files. But
hey,
if he wants to upload it to the incoming directory and have it appear
as
a "Holmes" directory at the same level as CTH then he is welcome to do
so.
<SNIP>

I hope Tom Hunt doesn't mind me posting his reply but I thought it too
important an idea to pass up (esp. with time running out). Besides,
as an avid Atari user I got kinda desperate (esp. since I don't think
I'd win your CD collection). :o)

Aaron, will this work for you?

Hi Ben,

That moron did the same to me a few weeks ago until I got him kicked off the remail it (the coward) was using. Now IT's gone to another remailer. If anyone
that twit abuses brings it to the attention of the remailer service they're using, before long the moron will run out of places to hide.

The error appears to be in the Atari800 emulator core, not just in
Atari800WinPlus. It also shows up in my Mac OSX version of the
emulator, Atari800MacX. I'll try to take a look at it, but we should
really report it to the core team, who has a mailing list for users.
Their webite, which you should visit if you haven't, is
atari800.sourceforge.net.

Sweet, that's the best way to do it. Yep, everything is zip.

> P.S.: Your documentation section seems to point to the games. Did you ever
> put in any manuals / walkthroughs?

As I have a 'huge' amount of manuals, txt and scanned, I was going to slowly add them alongside the game, thus the link to the games. But as usual, time doesnt permit.

Remember, send in a postcard, as the winner will get quite a lot of stuff that is not easily obtainable online, if at all.

Send in a postcard and win it yourself! You may be the only one that
enters, thus guaranteed a winner! ;-)

I dont expect many to actually take the time to enter, by sending a
postcard, so those that do, will have a high chance of winning.

For thos who dont know, go to www.atariworld.com and read about this simple
competition.

cheers

This utter non-sense has gone on too long. I dont like Ben's adverts myself
but I dont have to read them. The idiots that are annoying Ben with
anonymous posts & emails, and are spamming this newsgroup with various
crap should definately 'GROW UP!'

Get a life people, if you dont like Ben's posts, DONT READ THEM, like
I dont.

I appreciate Ben is one of the last Atari suppliers, and good on him for
sticking with it so long. I wish him well. His posts dont harm anyone,
unlike the childish dribble from some reject with too much time on his
hands.

If this is a standard 2.5" IDE HDD then it will also require 12v for the
motor. 5v is for the logic.

And if the 1200 is similar to the 800xl or 130xe then 5v is available at the
power in connector.

They were mainly sold in Germany I guess. They were called 800XE (instead of 65XE, as they are called everywhere else) because the 800XL was a big success. Their cases are made out of a different plastic, the OS tests 128kB (if it finds that much), and spells out copyright 1985 instead of 1983.

2.5" HDD's are usually Notebook HDD's and need only 5V DC. But in the 1200XL you also have 12V DC, so using a standard (but not to big/power hungry) HDD would be possible too. I guess both are available at the power connector.

Maybe you could zip and upload them to some ftp? Actually, I could create my own Atari site and make them available, if they don't weight too much.

I didn't think they were. One site I went to claimed they were so horribly built (using spare parts from just about every previous atari) that it quickly bombed. I'd like to find some images of the innards or close ups but can't find any.

Actually not quit true ....

the orignal 65XE does NOT have the ECI port. Those 65xe's are not sold in
Europe. But if you look at 65xe pictures in US ... you'll see they don't
have that tiny port next to the cartridge port.

The 800XE has the same print as the 130xe.

Greetz.

Look wat www.fonck.nl/atari

It's an interesting site with some pictures inside the 800xe.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have no beef with Ben, but its stuff like that (either Ben or the
people who pick on Ben, won't say & can't say) that is tearing this
group and the community apart. I, myself, have offered Ben a simple
solution: http://groups.yahoo.com/group/atariswapnshop but he chooses
to ignore. oh well. don't get me wrong, I have no problem with Ben
advertising on usenet (sometimes I wish B&C or Best Electronics would
advertise as well) espcially since he is one of a few atari dealers
left but I think we all need to do our part and ignore the trolls.
I've seen this sorta thing go on in other news groups (such as
alt.comp.freeware) and everyone over there agreed that when you do
make a group effort to ignore the trolls then more likely they'll go
away. They know they are pissing Ben off. They won't go away because
he keeps acknowledging them. It goes both ways. Holmes has the right
idea, if you don't like Ben's adverts, then skip over them. Come to
think of it, no one is saying much about people who post links to
their auctions on ebay, are we/they? Maybe Ben ought to consider
selling his stuff through ebay? :-\ Just a suggestion. This newsgroup
certainly isn't as active as it used to be for his adverts to take up
bandwidth (esp. when I'm positive a majority of us have more than a
56K connection, at minimum). But trolling and feeding the trolls take
up as much if not more bandwidth than Ben's adverts.

So, here I go once again pushing my yahoo group:
http://groups.yahoo.com/group/atariswapnshop

But these are my opinions. Whether or not you take them with a grain
of salt is your choice. :o)

Don't even think that! I think Freddy was one of the guys defending him. I hate to see you leave Freddy, do try to pop in from time to time to see if things are better, okay ?

I will try to make something of the source I got from you, thanks for that and all you have given to the Atari community!

Take Atarian care

Although I'm too fed up with certain 'discussions', wouldn't that be
exactly what certain people that seem to get their only kicks in life
from such things be happy about.
I think it would be much better if all of us tried to ignore what we
don't like here, and get back to what this group should be all about.

The 1200XL still uses the original 800 9V AC power brick rather than the
normal XL/XE type; not sure where those 5v and 12v sources might be...

Ofcourse!

If you can use the joystick with windows, you are able to use it with Atari800Win Plus. It takes the joysticks you have set-up in the control panel.

Btw. I use PPJoy (that something like LPTjoy) and a real atari joystick. That's even more fun.

6429. Re: 16 meg atr or xfd images

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-19 17:58:41 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <ardu10$pg0$1@reader12.wxs.nl>
Source record: 25699

Yes!

With ape you can create very simple such a partition. I suggest you put the big atr image on D2: in the emulator. Then boot a mydos .ATR on D1: and type O (config)
, 2 (drive 2), N (remove?), Y (configurable?), Y (high capicity?), 65535 (sectors) enter.

Then option H, and d2:

Now you have a 65535 sector formatted MyDos partition.

If you want to use spartados. Please set the 16mb partition on D3: or D4: and boot on D1: the spartados Toolkit .atr image. If you don't have it, I can mail you. There is a program called "hdinit.com" ... this program formats a HD on d3: or d4: You don't need to enter any sector size then.

After that. Copy a X***.DOS (spartados) to your formatted .atr and don't forget to make it bootable with the boot command.

It should work fine now.

Hi!

Hmmm I guess it's not a good idea at all to use the current from the Atari adapter at all. You'll need lots of amps to keep a stable +5 in your Atari. It's not good for your atari if the current gets under 5V.

Hmm,
this appears strange to me. I used ACVT to convert several ATR images
into DI format. when I later gave those DI images to a friend who had an
STE or TT, he told me that none of them were accepted by the XLdeejay.
So I tried it again, but still the XLdeejay refused to accept these DI
images (created by ACVT). -Andreas.

Well,
back then this was eastern Germany (or GDR), as well as eastern europe
(Poland, Czechoslovakia, Slovania, Bulgaria, Croatia, etc.). the main
headquarters for A8 computers had been in western germany in the late
80s - at least for a while...(but they only sold the A8 and other 8bit
stuff to eastern europe). -Andreas.

Well,
in europe (and especially eastern europe) atari sold both the 65Xe and
the 800XE, as well as the 130XE. Believe me, most if not all PAL
versions of XE computers (even the PAL 65XE) do have the ECI. Me, I have
a PAL 65XE and it definitely has the ECI. It also has a 130XE
motherboard, so I upgraded it to 128k and fixed most bugs (replaced the
faulty GTIA with a good one, replaced the buggy/incompatible OS with an
older one, added a Gate Array chip, etc. etc.)...
-Andreas.

P.S.: I also sold 2 of these Xe`s at my booth in herten (ABBUC-JHV
2002)...

Yes that's right.

But those 65XE's are not the same as originaly sold in US. Those 65XE were
orignaly without the ECI.

I'm searching for pictures. If I found them I'll provide you a link.

Marius

First of all, take a look into SIOspecs.pdf, available from
http://www.atarimuseum.com/archives/tech_docs_8bits.html
- if you haven't yet. It explains all timing values and details of the
SIO protocol.

The only further thing you need to know, is that the COMMAND-line is
either connected to the RTS or DTR pin of you serial port.

1050-2-PC uses the RTS pin, ProSys uses the DTR pin. But beware:
ProSys uses the RTS-pin for voltage-supply, so be sure to keep
it at +12V!

So just set the port speed to 19200, toggle RTS/DTR, and send/receive
data. That's it! (Yes, it is really this simple!)

The Xformer-cable is another beast, since it connects to the parallel
port (IIRC) and you have to send/receive data bit-by-bit. You most
certainly would not want to do that :-)

BTW: This summer I started to write an "SIO-library" for Linux.
(Motivated by Freddy Offenga's Atari Preservation Project).
It implements both SIO2PC and 1050-2-PC functionality and I'll
hopefully be able to publish it real soon now (TM). Currently, a few
people are doing alpha-testing and I guess the lower-level layer is
quite stable yet (SIO2PC stuff works quite reliable, even at
57600 bit/sec - both on my desktop PC and on my old 486SX laptop).

The most important thing that's missing ATM is some kind of user
interface. Actually, the user interface is pure command line at the
moment :-)

The source code is GPLed, so if you are distributing your software
under the GPL, too, feel free to use parts of it.

I _really_ hope I'll find the time to do some outstanding tests
the next days and then upload the software to my webpage. If you
want to have it earlier, please contact me by email and I'll send
you the current snapshot.

so long,

Hias

Hi,

> I have no beef with Ben, but its stuff like that (either Ben
>or the people who pick on Ben, won't say & can't say) that is
>tearing this group and the community apart....

This bickering will only tear the group/community apart if we allow it to!

IMHO The simple solution is to just ignore the cretin(s) who are stirring things up by posting these anonymous messages. Eventually he/they will get bored and go away.

>....I, myself, have offered Ben a simple solution:
>http://groups.yahoo.com/group/atariswapnshop but he chooses to
>ignore....

Unfortunately, a mailing list like that isn't really going to reach the majority of people that Ben needs to reach. :-(

>....Come to think of it, no one is saying much about people who post
>links to their auctions on ebay, are we/they?....

Possibly because those of us who find them to be a problem simply filter them out/ignore them?

>....Maybe Ben ought to consider selling his stuff through ebay? :-\

Please NO!!!!

>....But trolling and feeding the trolls take up as much if not more
>bandwidth than Ben's adverts.

Agreed, so can we all get back to chatting about the important stuff!?

Hmmm ... perhaps if they dropped the price down to earth levels, I would
MAYBE consider it.

Otherwise, WinUAE and Amithlon are fine for my occasional dabbling.

It might cost you a fortune, but perhaps you should take a look at:

www.ebay.nl

or

www.ebay.de

or

www.ebay.be

These are the dutch, german and belgian sides of EBAY. If you search for 800XE sometimes you'll be able to find...

btw. the EURO is almost the same worth as the US-dollar... so the most expensive 'joke' is the shipping (and perhaps some customs-tax?)

Marius

> has anyone burned turbobasic on ROM ? results ?

Well yse..

there is a small pcb upgrade for that atari 800xl/130xe allowing you
to upgrade to the computer with turbobasic built in. this was done in
germany.. and i have seen a working version

Video61 should also have a cartridge version of TurboBasic.

> my stuff from my Atari to my PC ?

This may or may not help you, but I regularly transfer files from my Atari's to my PC by connecting a simple phone line between the two, tell the PC to auto answer, and the Atari to send carrier. Not terribly fast, but it does work.

If your two computers are in other rooms, I take the hone off the hook until the line goes completely dead, then follow the above proceedure.

Hope this helps...

I have two BIOS ROMs. One for the 2 port and another for the 4 port
5200. I have recreated the bug using both ROMs. I could only find one
2 port ROM but the crash happens on all 4 port ROMs I've downloaded.

Take care,
DEBRO

you're telling me! I've got some programs myself that I can't find
anywhere on the net (such as I do believe I've got OS/A+ 4.0 & BBS
Express Pro 1.0 etc.) Stuff that I'm just dying to get my hands on
once again. A couple times in the early ninties I bought what was
left of a couple of users groups (it's how I got BBS Express Pro and
my 1 Meg MIO / HD) That's one reason my collection got so huge, not
to mention the PD disks of B&C and Computer Palace.

Exactly how did you manage that? I tried the phone cord direct method and never got one machine to see the other. Also our local phone system never goes dead; after the rapid busy tones, it repeats a recorded message that seems to prevent transfer unless one had two lines.

On the original question, a scsi card might allow access if you had the software to understand the directory structure and copy it over.

ATR isn't compressed.
I don't remember offhand, but XFD might not be either.

SCP most likely is. DCM definitely is.

Hopefully someone will actually answer your _question_, because I haven't ;)

You can eliminate the Percom and stock 1050 for starters.

The Indus required a special software patch for increased speed with DosXL;
otherwise it seemed comparable to the 810/1050.

The Happy and Doubler seemed about even and very quick. I didn't get much
experience with the 551.

.XFD has no compression and .ATR actually adds 16 bytes for the header.

.DCM does an adequate job not to be compared with those excellent utilities
from Phil Katz. I never actually tried Sparta's .SCP.

Hi DOn

Since it isn't actually a dictionary recognised term then your definition
isn't really relevant, I define spam as being anything that's of an unwanted
advert nature.

> living.
>
> Its against the rules, hence off-topic.

First, I was under the impression (and I guess I was right by what someone else said in another post) that Spam only applied to e-mail, not newsgroups.

Second, giving out e-mail addresses (a private communications venue) to spammers is in no way the same as posting an advertisement to a newsgroup (a public forum). Anyway, I wouldn't mind terribly being put on a mailing list if it actually had something to do with what I'm interested in, like Ben's ads have to do with the Atari community.

Third, other people use newsgroups to advertise Atari items they have to sell. The only difference I see between them and Ben is that he is trying to make a living by it (a feat in and of itself), and posts more frequently (which I don't personally see a problem with).

Fourth, even if it is against the rules, that doesn't make it "off-topic". It has everything to do with Atari machines (as that's what he primarily sells). Please tell me how this is off-topic.

Finally, the point of my post was not to say, "Everyone must agree with and accept Ben's posting, and submit themselves to off-topic spam". I was simply pointing out that while Ben's posts can be offensive to some people (yes, I was actually allowing for your point of view), the obscenities in the idiotic spoof presented as a response to the post was absolutely uncalled for, offensive, destructive to the community here, and off-topic, even more than Ben's ads.

As for the ads, if you don't like them, ignor them. If you can't ignor them, set your newsreader to filter them out. If you can't filter them out, deal with them. I don't see how they can hurt you in any way. They may actually be helpful to some of us here, and help support the Atari community as a whole through offering people wanting to purchase something for their machine a place to do that, while supporting a fellow Atarian's career. I think that's much more vital for the survival of the Atari community than

going around bashing each other like this.

It was Christmas of 1983 when I first got my Atari 800XL with the
1050 drive. So I would still have to go with it!

If DCM compresses files, why not choose it over XFD or ATR ?

Is there something these two have over DCM other than the fact DCM is
limited to 9999 sectors ?

I find DCMs are really nice to work with on a real Atari, and I like to archive stuff with them. On the other hand, when working on a PC, especially when working with emulation (i.e. Atari800 or Atari810), I like to avoid all compression... mainly because compression really isn't much of an issue with 8-bit software on modern storage devices and also its nice just to dump an .atr right into a hex-editor or disassembler as-is without having to decompress.

6508. MyIDE !!

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 05:48:28 UTC
From: James King <utah_lanman@yahooo.com>
Message-ID: <arhs3c$mg2$1@terabinaries.xmission.com>
Source record: 25828

Just started to setup and configure my new MyIDE interface. Its currently connected to a 576k XE with BlackBox.

First thing I noticed was that the MyIDE was not compatible with SDX and/or Rtime8; with those carts in, my machine was unable to boot up without significant error.

After removing those carts and inserting MyIDE by itself, I boot-up MyDOS 4.5 (hard to find my disk after using BB with 850mb HD) and ran the utilities.

After a few seconds, the connected 18gb 3.5 inch drive from one of my older laptops sputtered and came alive! Running the sector check tonight, and it will probably run all night at this rate.

Once I FDISK the drive (probably another evening to format?) and create my paritions, will I be able to use my standard SDX and/or SpartaDos 3.3 operating systems? The manual wasnt real clear, and it appeared as though I had to use a unique OS??

Anybody else purchase and configure MyIDE?

At any rate, its unreal to see my trusty old (almost 20 year old!) 130XE running a 18gb hard drive from my old Toshiba Tecra 8200 laptop!

Source record: 25830

Are you using a ROM version of the MyIDE patch or are you using a RAM
version of the MyIDE patch?

With the RAM version you are not able to use spartados (you can use bewedos)

I wrote a (beta version) of a new 'fdisk' and it's called MyTOOL. It's look
like the black box menu (other colours :-))) and you are able to switch
partitions, deselect them, and name them and save them into a partlist.dat
file.

In next versions this partlist.dat is saved on cylinder 0 of the HD... now
you have to use an external file.

If you are interested in my software, you can mail me. I'll send you an .ATR
file with the software.

Greetz.

Stephen J. Tucker is in the middle of a "movement" (I don't know the english word... ehm... when you are changing from one place to another)

I've mailed with him about some bugs, and he wrote me he is VERY busy at the moment, and does not always has acces to his mail.

btw. I bought a registered version too. It's definately good.... but i prefer the version for win98... there are some timing problems in the XP/2k version with the printing routine, and a naughty bug in the pc-mirror emulation. Perhaps these bugs are solved now, so don't decide to not-register please!

Greetz.

I'm not sure I understand the question. Right now, I'm using MyIDE as a
cartridge in the PBI/ECI slot of the 130xe. Beyond the cart, I've just
loaded up the .BAS software from the supplied floppy to configure.

> If you are interested in my software, you can mail me. I'll send you an .ATR

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

6517. 8-Bit-Show

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 10:27:35 UTC
From: Sintech <sintech@online.de>
Message-ID: <arid03$68a$1@news.online.de>
Source record: 25837

Hello Guys,
there are plans here at SINTECH to make a big 8-Bit show here in Stuttgart,
that's in the south of Germany. However, we need some user-groups/clubs to
assist us with this.
Planned is:
- A computer-sales-range with several sellers from all over Europe.
- A Club-range where all the computer clubs/groups can show their offers and
meet their members as well as hopefully see many new users.
- A soccer-tournament with Teams for each computer.

All will be held in a big city hall over here and there are showers for the
soccer players. The field is just in front of the hall, so not far away.

Plans are for Spring 2003 or Autum 2003. I ask all people here for their
comments, if they would like to come, any suggestions what else to offer and
if anybody is willing to help.
There will be a table fee for the sellers and maybe a small entrance fee of
1 Euro.

Please write me if there is a demand for such a meeting. We ask for C-64,
Atari, Amstrad and Spectrum-Users.

Regards

Thomas

> > fit into a cartridge and has TWO USB ports.

> Maybe the cartridge is on the Atari's buss.... that would be impressive.

Maybe I wasn't clear on this, yes, cartridge as in 'Tennis', 'Pool Position'
etc.
It plugs into the cartridge port of your 8 bit Atari and should fit into a
cartridge housing (after you take the original pcb out that is). He used
two USB chips, one on each side of the PCB and maybe some other stuff too.
Not that much on this cart. It was a prototype. He still had to move the
components a bit, so the connector (2 USB ports) would fit inside the
cartridge housing.

I noted Marius' reply about the printing bug when using APE for Windows with XP. Is anyone else using APE with XP and has the same printing problem?

APE is great, but it is my only method of printing with my A8, and this bug definitely affects use with my XP Home setup. In my case, the bug causes the printing to be very sporadic. Let's say that I have a Basic listing to print. I type "LIST P:", and printing will start -- maybe for a half second, maybe 2 seconds. Then it stops and depending on the timeout setting, may or may not restart. About the most that I can get correctly is 5 or 6 lines at a "spurt".

My solution to this was to set up a dual-boot W98/XP system on my PC. The W98 side does everything perfectly with APE (at least all the features that I use.) As it turned out this was a good move, because there are other things that don't work well (yet) with XP.

Howdy Ron, folks

> The 1200XL still uses the original 800 9V AC power brick rather than the
> normal XL/XE type; not sure where those 5v and 12v sources might be...

It's probably converted internally somewhere. I know the 800 uses 12V DC
for it's colour circuit where the XL/XE(GS) has to first add 5 V DC to 4.4V
DC before it goes to the potentiometer.

Hey,

Has anyone seen this fantastic demo?
Wow, I never thought the Atari 800 was capable of such things.
Anyway, have a look for yourself. Check out http://numen.scene.pl

Regards,

Michael

You're right it is very impressive. I too, never thought the 8 bit could do such things. If this demo had existed back in '83, Atari might still be here today.

Hi, I'm Ben Smith of Bravo Sierra Computers. I sell Atari Computers and Atari Jaguar Games. The Great Communicator once said, "It's a Recession when It's in your Neighbor's back yard. But when It's in your back yard, it's a Depression!". Due to the Economy,Atari Business is extremely slow! Thanx to all those who have stood up to support me, FREE Speech and Atari Commerce in the face of Tyranny! Atari sales are really slow inspite of all the support I received in the Atari NewsGroups.Even with all the Talk. Those that supported me, I need to say, I really need your Business now!! To those that said they would buy from me or were planning to buy from me in the future. Now is the time! Take advantage of Atari Holiday Discounts! Help me make enough sales so my Family can have a Merry Christmas! E-Mail atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/specials.htm Atari Holiday Sales Special!

Got Atari Questions? E-Mail or Call Ben 24Hrs, anytime at (503)256-9974! http://www.aracnet.com/~atari/numbers.htm Phone contact info and Hours!

http://www.aracnet.com/~atari/whybuyben.htm Ben's Living References! http://www.aracnet.com/~atari/jagsales.htm Jaguar Sales Web Page! http://www.aracnet.com/~atari/testing.htm My Test Standards.

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: BenSells@atari.org or atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.atari.org or at http://BenSells.atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at atari@aracnet.com or BenSells@atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I'll send you the package.

About the question... if you want to use MyIDE you'll need another OS in
your ATARI. Only the My-IDE os will work.

If you don't want to modify your atari, you can use a software-OS (by
booting the Masterdisk side B (the disk that came with the interface!) ...

My question is: are you using the MyIDE OS in ROM (so you modified your XE)
or are you using MyIDE with the software-OS (by booting with the MasterDISK)

You should know :-) because, without knowledge about this, you aren't able
to use MyIDE.

When I was in communication with Steve about several bugs, he discoverd some differences between two compilers he uses.

Because of THAT there are some bugs in the software. Since I switched back to win 98 (I only did that for APE :-) I don't know if with that action the XP/Win 2k bugs are gone too.

He's working at it (I hope)

Greetz.

James,

I'm using MyIDE on a stock 800xl and Wow it is great. I miss not being able to program with Turbobasic or use Spartados. So the next thing I will be doing is burning a rom to replace the original. The information on how to replace the rom is a little fuzzy, because the schematic is just line art drawing and limited instructions. More detailed info would be a great help. My hard drive is only an older 133mb drive and now I will take that out and get a larger because the 133 is full. One hint about doing the sector checking I just did a quick check and was done in about 2 minutes. 20 Gigs should only take about an hour. Don't even try to verify because it will take forever. A hard drive that has been previously partitioned and formated on a PC machine will be clean and not needing to be verified. Partition for drive 2 *D:2* until all dos setup and imageing is done, then use another program called Mytool.com by Marius Diepenhorst to swap partitions at will. Congratulations on getting the MyIDE interface.

RoyE

Hi James,

this "Terrorist" claims it has not been kicked off of any e-mailer/
re-mailer service. Could he been lying? This Gutless wonder is just like
the Terrorists in the News. Except those Terrorists claim responsibility!
And they die and go to Paradise with their Virgins. This Particular
Terrorist will Die and go to Hell and be Satan's favorite Sex Toy and be
regularly abused. This "Terrorist" Claims Anonymity. But most of us are
sure who he is. Who else has protested so much, hounding me to the point
of absurdity. All because he hates/loathes my opinions. Stand up for FREE
SPEECH while you still have it. Before you lose the right and privilege!

===Ben===

> Now IT's gone to another remailer. If anyone that twit abuses brings it
> to the attention of the remailer service they're using, before long the

I have no modified the XE at all. I've been booting MyDOS 4.5, then
running the .BAS utilities so far.

Regarding my XE, it's already modified; it has the three way CSS OS+ ROM,
so I doubt I'll be able to do much more modification to that machine.
I suppose I can pull out one of my 256k XL's and integrate the cart
internally since the HD is only a 3.5inch laptop device.

Anybody want to tackle this for me? Willing to pay minimal! <grin>

I agree. I've talked to Brad at Best Electronics and Lance at Video 61 and
advised them to run some Holiday Specials. I don't think of it as
competition. We Dealer's have to much in common and regularly refer
Atarians to other Dealers when we don't have what they need. We believe
it's better to keep them happy rather than have them abandon their Ataris
because they cant get their Atari needs fulfilled.

6540. Re: XFD - DCM - ATR - SCP

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 19:22:19 UTC
From: Evil Moo <evilmoo@thorntv.com>
Message-ID: <3ddd347b_7@news.newsgroups.com>
Source record: 25661

IIRC the formats work like this:

XFD: 'raw' disk image (720 sectors * 128 bytes = 92160 bytes)
ATR: 16-byte header on front of raw image (16 + 92160 = 92176 bytes)
SCP: variable header indicating disk size and which sectors are non-zero
DCM: the disk is split it into several 'sections'. Blank sectors are skipped
by
a flag in the sector header. If it is not blank, it is one of the
following:
1) full 128-byte sector
2) RLE-encoded
3) duplicate of last sector
4) 'diff' (comparison) to last sector

So the short answer to your question would be 'DCM'. :)

6541. eBay Auction - Page 6 mag Issue ONE (VERY RARE!)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 19:42:10 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1037907733.48294.0@iapetus.uk.clara.net>
Source record: 25662

Hello All,

I'm auctioning a copy of Page 6 magazine issue ONE, which is exceptionally rare. Here's the info and link:

Here's your opportunity to own an original copy of Page 6 magazine Issue ONE. This issue, released around 20 years ago,
is exceptionally rare. Only 750 copies were ever printed. The vast majority of these went straight to members of the
Birmingham User Group (BUG), because Page 6 was initially going to be the BUG newsletter. Very few issues were ever
sold outside of the group. Many people's collections of Page 6 magazine are missing issue 1. In over 15 years of supporting
the Atari 8-bit, I have only ever seen 2 copies of Issue 1, including the one for auction now. This copy is in near perfect
condition, with no tears, rips, staple rusting, etc. It looks almost as good as the day it was sent out! The bidding for this
item must be sensible and reflect the rarity of the item. Postage costs (shown later) are expensive, but this covers the
cost of a protective envelope and mandatory registered post. Good luck!

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=803315271

Well,
I already know that the NTSC versions of the 65XE don`t have the ECI...
you can read that in the A8FAQ by Michael Current... -Andreas.

Message-ID: <3DDD3AFC.A0D4EC6A@students.uni-mainz.de>
Source record: 25664

Well,
this pcb was made by Michael Pascher and sold via ABBUC in the early
90s. it is not a cartridge, but a parallel bus device. Only very few
were made, since htey were very expensive then... -Andreas.

6544. Re: XFD - DCM - ATR - SCP

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 20:01:49 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DDD3BAD.272A22E3@students.uni-mainz.de>
Source record: 25665

Well,
afaik XFD and ATR images are uncompressed. Don`t know if DCM or SCP (or DI) has the best compression rate. I tend to zip ATR or XFD images, this way the compression rate is much better than any of those other images... -Andreas.

mad ATARI user alternate schrieb:

Message-ID: <3DDD3C9C.477333AE@students.uni-mainz.de>
Source record: 25666

Well,
depends on the emulator you are using. I use SIO2PC - it only accepts
ATR images (not DCM, not XFD, not SCP, not DI). Of course you can easily
convert those DCM images into ATR, but if you have some CD`s full of
images, converting thousands of them is a pain. thats why I like the
Pooldisk Too (over 5000 images in ATR format) and thats why my own image
CD also contains ATR images... -Andreas.

6546. Re: MyIDE !!

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 20:11:48 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DDD3E04.5324684E@students.uni-mainz.de>
Source record: 25667

Well,
then you use a RAM version of the drivers and/or OS. The drivers are
also available as a ROM, you can piggy-back this new OS (called SOS)
right over the old one and put in a switch to switch between these two.
The ROM version can be found at Sijmen schouten`s homepage. then you
merely have to find someone who burns this 16k binary into an Eprom...
-Andreas.

6548. Re: 8-Bit-Show

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 20:22:17 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DDD4079.F1ADAE73@students.uni-mainz.de>
Source record: 25669

Well,
I would be very enthusiastic to see this show. but I have my doubts,
that there will be more buyers/sellers than at the "8bit-boerse" in
frankfurt-bornheim (Germany). On the other hand, let`s give it a try.
And while thinking about it, in Spring there is already an Atari 8bit
fair in schreiersgruen (March 2003) and in Autumn/Fall (usually
Spetember) there is the Unconventional in Lengenfeld. Hopefully you find
a good date, that does not interfere with those
meetings/fairs/conventions. (of course there are also many other fairs
and conventions for various computer platforms in foreign countries,
like Poland, Czech Republic, Slovakia, etc. I mentioned those two
events, because you want to make your show in Germany)
-Andreas.

P.S.: Call ABBUC or the regional groups RAF and Foundation Two. They are
always there if there is any Atari show in Germany...

So, I guess that means you think TV advertising is SPAM? What about
radio ads? Or magazine ads? Is all that SPAM too?

I think your definition is far too broad and not one that would be
accepted by those on the internet.

6550. ABBUC programmers contest...

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 21:09:33 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DDD4B8D.EDE6E216@students.uni-mainz.de>
Source record: 25671

Hello Folks,
at the ABBUC JHV in Germany, the club members of ABBUC decided that it is time for new *quality* A8 software. Therefore the ABBUC now starts a programmers contest. you have to program a game or application (not a demo!) that should be finished until September 15th 2003. The rules (quality control, copyright, etc.) are not completely set yet, but so far I can tell you:

1) ABBUC spends 1000 Euro for all entries; first prize is 500 Euro, second prize is 200 Euro, third price is 100 Euro; and the remaining rest will be split for the remaining programs and places... (note that 1 euro is almost one dollar; sometimes more, sometimes less...)

2) if you send your program (must be a finished one, no demo or pre/beta-version!) to ABBUC Germany, and win a price, then ABBUC gets the right to place it onto its ABBUC magazine (which has around 400 subscribers)...

All other rules are not completely set yet... I will tell you more soon...
greetings - andreas.

Ohw ok! thanks I didn't know that.

Btw. the 65XE I bought from you at the JHV is doing a great job! thanks for selling good stuff to me! It's nice when atari's are in a great shape; but this one was almost BRANDNEW.

Thanks again!
MArius

6552. When comes the pixel-level emulation in stead of scanline?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-21 21:45:51 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <arjk32$8mv$1@reader13.wxs.nl>
Source record: 25673

Hi!

Just wondering. Is there any development on the graphics output in the emulators? Demo's like Joyride (and other software) that is using more graphics modes on one scanline, are not emulated well.

Will it be possible in future to emulate this?

Thanks
Marius

6553. Re: MyIDE !!

> Which OS are you using? Are you using the MyIDE or MyDOS?

I think you are confusing some things. MyDOS is a Disk Operating System. Any compatible (hard) disk drive can be used with MyDOS or any other atari DOS.

The question is: how does your ATARI computer (your 130XE!) communicate with the MyIDE cartridge. With the MyIDE Rom chip, or with the MyIDE soft-OS. After you loaded the SOFT-OS you should boot a DOS (like MyDOS)

If you are using SOFT os or not... you still have to boot a dos like MyDOS or Bewedos etc.

There is no special DOS for MyIDE (not et....)
And not needed too.

Marius

Unwanted by whom ? I am not a big fan of all the junk in my email, from Hong Kong, or whereever, with porn and shit. But I do want Ben's ads, so who is to say if it's spam or not then ? And why is your definition better than the others ?

Hey,

I was watching Country Music Telivision and I was listening to a Video, I think it was called "1980 something" and when I looked, I caught a glimpse of Kids playing an Atari 2600, showing the Console and Joysticks on home movies! Brings back memories.

That's fine. I do Business with and support other Atari Dealers like Video61, Best Electronics and yes even B & C ComputerVisions. Atari Dealers are like a BrotherHood. We help each other out. All I ask is my Share of the Atari Customers. I don't need Terrorists like the one who's been hounding me mercilessly, all because He Hates my Politics. No FREE speech here! The Kicker is, I checked and B & C has no record of ever selling to Him. What a Hypocrite! I believe he only does Business with Pirate Sites!

Oh, BTW, when complaining about my Posts, maybe you should delete my Ads from your posts. Since you find them offensive.

I would like to spend more time in the NewsGroups, but with the Mob Mentality, infantile behaviour, plus it gets so depressing seeing people Advertising Atari stuff for sale. When I read the Sale Posts, I discover it's for auctions, plus I'm persecuted for trying to professionally support the Atari. Not making enough to pay my Bills.

I believe most who have decided not to buy from me have Pre-Judged me. Another word for Prejudice. Most of you have not given me a chance to serve you.

Those who want to crucify me over spam need to evaluate this on a case by case basis. Judge me on my merits, not on a one-size fits all. Dont throw out the Baby with the Bath Water!

If I could, I would spend more time in the NewsGroups. But Not only does E-Mail keep me busy, I have responsibilities,like acquiring new inventory, Testing New Inventory, Cataloging and Pricing New Inventory, Updating my WebSite, and putting my Inventory in my WhereHouse. I have to process incoming orders with a less than 24 Hour Turnaround, Maintain my Catalogs. My Workspace has Boxes and Crates of Inventory I haven't processed, since I need to process it all, I can't store all my Inventory.

You try being one of the last of the Atari Dealers still Advertising. It's not like they don't need the Business. They just don't want to put up with the Mob Mentality, like I have. Not once do I get a reward or even a Pat on the Back.

Never, have my attackers tried to work this out. Like the Biblical Principle. Instead of coming to me to work it out, they RIP-ME-APART

publicly in the NewsGroups where it get's them the most points.

Do you accept Credit cards yet? Or Paypal? That was the reason I
couldnt buy from you the first time, also your prices seem a bit high on
some items. But I'd consider buying from you if you took Credit cards
now.

Other wise, I'll only be supporting those that do.

I can only say that I have installed many, many Newell upgrades. Too me,
they were easier and more stable.

The Rambo upgrades were compatible with a few more commercial products,
but have been told that some programs weren't nice and trashed the system
as the banks not switched(0-16K, 32K-64K) weren't protected from access.

Dear Marius,

thanks for your fast answer and the MyIDE tool. I just tried it
yesterday, and I must say, it's exactly what I have missed in the
original software by Mr. Atari.

MyTool is very easy to install, it recoginses the existing partitions
and you can name then change their order or switch some partitions
off.

If you want to, I can write an article n MyTool for the german ABBUC-
mag.

Bye,
Michael

OK, I'm going to tell you a story. And it's true. When I was 15, I dropped out of High School, soon afterward I had an episode, became Hospitalized and Disabled. Currently I'm approaching 39 and not only am I still disabled, but I have other health problems adding to my condition. I've been Disabled for over 20 years and I've been collecting Disability for nearly 20 years. I've been an Atarian since maybe 1980. Most of my rehabilitation is/was through my local Atari Clubs. Part of what I lost, I replaced by learning how to function using my Atari Computers and using the Atari Computer Clubs for support, fellowship and an outlet to get involved and serve my fellow man in the Atari Community as a Teacher, SIG Leader, BBS SysOp, NewsLetter Editor and for a number of years, I've been successful as Vice President of my Atari Club. My President warned me that all unfilled Board Positions, I would have to fill while they were vacant. Lets just say I got quite an education. The Disability I receive is a mere pittance, unable to sustain my most basic needs. Still I must survive, and my skills lie in Atari. As well as what I love to do. It gives me a reason to wake every morning and hope not to give up and go Tango Uniform. I work to stay independent. I don't make a MINT doing this & I can't keep enough in the Bank to Maintain a Bank Account. What I do have going for me is a Family with Land/Homes/Property/Resources supplying me with my Home, Wherehouse for my inventory and facilities to run my Business with. As well as love and moral support. My Father's words stay with me. Don't use Credit Cards as they are a good way to run up Debt. So for myself I have no Credit Cards. The Plus side to this is I have almost no Debt. Still, I need to be Independent. So besides using my Atari Business as my Career, it also serves as Therapy and hope to live and continue. LikeWise, I have Moral reasons not to take Credit Cards for my Business. The old Bible Quote "The Debtor is the Lenders Slave!" On my Principles I avoid Credit Cards. And along with what my Father Taught me. As far as PayPal goes, Since the only Computer I use, know how to use, want to use, own, have and the only Computer I get on the InterNet with is my Atari ST. And when I spoke to PayPal about Atari Compatability, I found with all the encryption codes and other problems, PayPal is not compatible with my Web Browser! And it won't do for me. As far as Credit Cards go, It's more paperwork and more trouble than I need. But then you probably don't believe in Hiring

the Handicapped. So I forgive your ignorance. On, the other hand when a Customer Mails me a Postal Money Order to my P.O. Box, The Post Office will Cash it for me on the spot. And with a quick turnaround, the customers order goes out the same day, usually from the Post Office. And while I'm their, I can mail a Postal Money Order from the Post Office to Pay My Bills. So if you still insist on using a Credit Card or PayPal. I won't hold it against you. And for those wanting to E-Mail me telling me I need to upgrade my Computer to get on the InterNet. I'm not interested. The same goes for my Software and Web Browser. I'm comfortable the way it is. And I'm not willing to change/upgrade my Web Browser to do PayPal.

Howdy Andreas

AM: "I would be very enthusiastic to see this show. but I have my doubts, that there will be more buyers/sellers than at the "8bit-boerse" in frankfurt-bornheim (Germany). On the other hand, let`s give it a try. And while thinking about it, in Spring there is already an Atari 8bit fair in schreiersgruen (March 2003) and in Autumn/Fall (usually Spetember) there is the Unconventional in Lengenfeld. Hopefully you find a good date, that does not interfere with those meetings/fairs/conventions. (of course there are also many other fairs and conventions for various computer platforms in foreign countries, like Poland, Czech Republic, Slovakia, etc. I mentioned those two events, because you want to make your show in Germany)"

Your forgetting to mention that the "8bit-boerse" is, like I guess the Sintech 8 bit show will be, a show for ALL 8 bits of ALL brands, incl. commodore, apple, etc. And that "Schreiersgruen" and "Lengenfeld" are Atari only shows/meetings.

be
> here today.

I did some testing on my 1MB XEGS and can say that the following demo's are
great (maybe not all as good as numen, but...):

X-Demo, Nonejm, Zero, Atari 130XE Shinny Bubbles, Muppet Movie, Relax, Ergo
Bibamus, Total Daze, De Themo, De Themo 2

Ofcourse, Numen runs on my 1MB XEGS too.

I downloaded a lot more, but some (under 10%) didn't run and some I couldn't
un-ATR.
BTW some of those above need 320kB.

Source record: 25696

One of the last XE boards that Atari released in the U.S. was a "Fits-All". It was labeled as "130XE". It was sold here as both 65XE and 130XE with 64X4 DRAMS and also had configuration sections for both NTSC and PAL versions. It does have the ECI on it. I've got one of these.

Supposedly, one of the reasons that Atari made a run of these was sales to Cable TV operators who used Atari's in their operation. At that time, our cable provider was a small, rural company and they did use 130XE's. Wish I had a 130XE version of this board so that I could see what I need to add to upgrade my 65XE version...

An outfit in CA also made an 8-bit clone with a 16-bit version of the 6502 that could address memory above 64K. It had a version of the Black Box built in as well as 3.5" drive(s) -- again supposedly mainly aimed at cable operators. I saw one of these at the World of Atari show in LasVegas in 1998.

And IIRC there was a company located in Dearborn, MI that had sold memory upgrades for these 4X64 machines. Wish I'd bought one...

Larry

Howdy Larry

> Wish I had
> a 130XE version of this board so that I could see what I need to add to
upgrade
> my 65XE version...

Two 64x4 RAMchips (simular to those that are already in there)
One CO25953 (or you can use a GAL and a 74LS95, see my site)
Capacitors (same as located to the left of existing RAM)

Remove the zero ohm resistors where it says U34.
Solder in a precision socket.
Solder in two precision sockets where RAM should be (below the existing RAM)
Solder in the capacitors next to the new RAM sockets.
Press CO25953 and RAMs into place.
Ready.

BTW I guess your computer uses 64x4 RAMs, I've seen 65XE with 64x1 chips.
In that case you need 8 of those plus 8 sockets.

CU Mathy van Nisselroy

PS I did this upgrade to my 65XE. It works.
You can find the CO25953 at Best for 10 US$ or B&C for 12.50. (or check out
my site an use a GAL and a 74LS95 also known as U35)

This is the program I use:

http://www.hcrburk.de/hpatari.html

When I right click on a file inside an atr imaage and select copy then
I will attempt to open / view another disk image (with enough free
sectors) and select paste and I get the error "Path not found!" I'm
looking for a utility that will let me xfer files back and forth
between disk images.

YES! That would be VERY nice. My German is not so well. I was the only one at the JHV that had to talk in English :-)

There will be update releases in future. I think I should set up some kind of simple internet site. That is easier for others to download etc.

Thanks again!
I'm looking forward to read your article in ABBUC.

Ben,

First and foremost I would like to publically thank you for coming on here and defending your point of view. Perhaps people are pre-judging you but they had nothing to go off of. Sometimes you have to take a risk of looking like (even more of) an ass in order to get your point across.

Ben, Your *business* needs to support credit cards. You attribute your lack of success due to x factors which is plain and simply wrong. I've convidered buying from you but I usually turn to ebay. Why? Ease of use. I can pay with credit cards and paypal.

You don't have to use credit cards yourself, you just need a merchant account and the increased business you get from it should pay your fees. Paypal has no monthly fees but simply a per-transaction fee. Albeit higher than visa merchant accounts!

Therein lies the problem ben. It seems all your life you have been either unwilling or unable to learn to change for the world around you. In most cases that makes sense, but when you try to run a business, YOU have to give in and bite the bullet sometimes. I don't know why I feel like i'm talking to a 2 year old. I would think someone of your caliber running your Atari groups and other such things would know that. Your consumers are a NICE bunch of people that tell you EXACTLY what's wrong. No market studies, no crap. We don't want newsgroup spam and we don't want lack of payment options... and if that means that you have to get up off your ass (or wheel chair (don't know which)) and go out and get a P2-266 (for around $100USD) (because high speed Atari's are a little pricey), so that you can browse paypal and look for an internet visa merchant account, or advertise on local Atari websites, that's what it means. And funny, paypal is neither a credit card nor a merchant account but it does have the added bonus of giving you instant credit card acceptance. But hey.. I'm an idiot and I don't know how to run a business. The customer is ALWAYS right.

Everyone respects your disabilities, though I don't know what they are. Everyone in America understands that disability isn't enough to live on in

this country. But your problem isn't that you CAN'T do something, it's that you WON'T out of pure stubbornness. And frankly, that causes me (and probably other people) to ignore any attached sob stories and chalk you off as a (some 4 letter word).

I've always been willing to respond to you ben. But you'll probably have to go out and get a Winbox (because linux is really really really complicated (laughing)) in order to browse it. Besides. I know for a fact that while CAB doesn't look pretty on my site, it works.

sigh. I don't know why I care enough to respond.

Have you watched the sitcom "Do Over?" Last week's episode showed a 2600
console, although it was turned off. (The father took it away from his
son.)

Have not used that; been satisfied with AtrUtil95 1.13 by Ken from:
http://home.earthlink.net/~atari8bit/a8emulators.html

caveats:
no cut & paste support; must export to a file from one image and import that
file to another image.
will not extract/import to Sparta format images nor extended area of 1050
dual density.

Obviously I don't have a good understanding of MyIDE yet. My perception
was that there was a MyIDE specific OS that was required.

I do not have a MyIDE specific ROM or ROM update, and only have the
diskettes that were provided. I guess I just need to understand what I
need to do after creating my partitions. I'd also like a better
understanding of how to use the MyIDE with SpartaDos and/or SpartaDos X
and if it (myIDE) can coexist with my BlackBox.

>Pirate Sites!

So because he's fed up with your constant spam, he's a terrorist and a
pirate? Sure.

>Oh, BTW, when complaining about my Posts, maybe you should delete my Ads
>from your posts. Since you find them offensive.

It's called proper formatting of a followup. I don't find them offensive,
I do find them annoying.

>I would like to spend more time in the NewsGroups, but with the Mob
>Mentality, infantile behaviour, plus it gets so depressing seeing people
>Advertising Atari stuff for sale. When I read the Sale Posts, I discover
>it's for auctions, plus I'm persecuted for trying to professionally
>support the Atari. Not making enough to pay my Bills.

You are persecuted for being a spammer.

>I believe most who have decided not to buy from me have Pre-Judged me.
>Another word for Prejudice. Most of you have not given me a chance to
>serve you.

No, you've been judged by your *actions*. And as another poster said,
your lack of accepting credit cards or PayPal are two huge strikes against
you compared to other resources for the same merchandise. Why should
anyone give you a chance when it's a huge pain in the ass?

>Those who want to crucify me over spam need to evaluate this on a case by
>case basis. Judge me on my merits, not on a one-size fits all. Dont throw
>out the Baby with the Bath Water!

What would those merits be? You spam and have a poor selection of payment processing. Your prices seem high and you don't seem to have any merchandise that can't be gotten elsewhere cheaper and easier.

>You try being one of the last of the Atari Dealers still Advertising. It's
>not like they don't need the Business. They just don't want to put up with
>the Mob Mentality, like I have. Not once do I get a reward or even a Pat
>on the Back.

You appear to have a persecution complex.

>Never, have my attackers tried to work this out. Like the Biblical
>Principle. Instead of coming to me to work it out, they RIP-ME-APART
>publicly in the NewsGroups where it get's them the most points.

What is there to work out? You are confusing Internet retailing with marriage.

6591. FS : Lots of new ATARI XE carts/some hardware

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-22 18:39:41 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0211221039.3deab213@posting.google.com>
Source record: 25562

Hi,

I have many ATARI XL/XE cartridge games for sale.

Most of the games are XEGS carts , all boxed/shrinkwrapped , new.

Theyï¿½ll work with all ATARI 800/130 XL/XE computers with 64K.

The old ATARI games such as Moon Patrol/Millipede will work with all
ATARI computers (ATARI 400/800 600 XL/800 XL/XE/130 XE/XEGS) , but
some of the ATARI XE carts like Airball require 64K.

We have : (price : perfect / box slightly damaged)

Ace of Aces (10/7)
Archon (8/6)
Airball (10/8)
Ballblazer (6/5)
Battlezone (15)
Crime Buster (Lightgun req.) (8/6)
Crossbow (Lightgun req.) (5/3)
Davidï¿½s Midnight Magic (7/5)
Desert Falcon (7/5)
Eastern Front (8/6 or 5.- with heavï¿½ly damaged box)
Final Legacy (6/4)
GATO (6/4)
Hardball (6/4)
Joust (6/4)
Lode Runner (8/6)
Millipede (5/3)
Millipede (small box) (5/3)
Moon Patrol (8/6)
One on One Basketball (7/5)
Pole Position (7/5)
RealSports Football (8)
Rescue on Fractalus (10/7)
Star Raiders 2 (8/6)
Tennis (6/4)
Thunderfox (6/4)

Microsoft BASIC/Disk (10)
Mickey in the Great Outdoors/Disk (3)
Scram/Tape (4)
Touch Typing/Tape (7)
Escape from Traam /Tape (1)

price in $ or Euro.

All these games are NTSC and PAL compatible although Lode
Runner/Davidï¿½s Midnight Magic have no color on PAL systems.
Post a follow-up to this message.

Hardware :

CX-30 Paddles (8.-)
CX-50 Keyboard Controllers (8.-)
Footpedals (5.-)

You may also look at my auctions on ebay , there are lots of ATARI
2600/7800 games , too.

> Obviously I don't have a good understanding of MyIDE yet. My perception
> was that there was a MyIDE specific OS that was required.

The specific OS is booted from either Side A or Side B of the Master
diskette. This is called the soft OS. The soft OS resides under the
original Rom OS. Under the Rom OS is also where programs like Turbobasic
and Spartados put some of there code. The soft OS is replaceable with an
Eprom coded with MrAtari's OS replacement. When you have the new Eprom in
place then the area under the rom becomes available for use by SpartaDos and
Turbobasic and any other software that uses this storage location.

> I do not have a MyIDE specific ROM or ROM update, and only have the
> diskettes that were provided. I guess I just need to understand what I
> need to do after creating my partitions.

Boot with either Master side A or Master side B. Side A is for internally
installed MyIDE's 'wires soldered to card and the required pins inside the
Atari'. Side B is for the cartridge plug in MyIDE 'fitted into a game
cartridge and inserted in game slot.' After booting then place Driver
diskette into floppy drive and press SELECT to continue to load DOS (ie..)
Dos 2.5, Mydos 4.5, or anyother DOS that does not use the memory space under
the OS Rom.
> I'd also like a better
> understanding of how to use the MyIDE with SpartaDos and/or SpartaDos X
> and if it (myIDE) can coexist with my BlackBox.

Sorry I think that SpartaDos uses memory area under rom and will overwrite
your soft OS, destroying access to the Partitions on MyIDE hard drives.

Regards
RoyE

BlackBOX

If you don't use a MyIDE rom-chip; you are not able to use blackbox and MyIDE at the same time.

The BlackBOX io routines are turned down at the moment you booted MyIDE Patch.

I don't know if the BlackBOX io is working when you use a my-ide rom-chip, since i don't have that rom.

Advertising is expected on commercial media, that's what makes it
commercial, and when it pop's up on a licensed subsidised channel then i
complain. SO it seems the same theory applies.

Okay Ben, that's fine, but if you dont take credit cards, then I cant buy off you. Simple as that. It's so much easier for me to pay via a credit card, then to try to get a money order that you can actually cash over there, that it's not worth the effort, not when I can use my CC at other dealers or ebay. Thanks for your answer. I wish you well. Hopefully your local US people will support you.

more
> than Ben's ads.

I didn't even acknowledge this spoof branch of the thread and completely
agree that if someone has something to say they should do it other than
anonymously as we are now.

> As for the ads, if you don't like them, ignor them. If you can't ignor
them,
> set your newsreader to filter them out. If you can't filter them out, deal
> with them.

Your missing the point entirely, i shouldn't have to filter them, the nature
of the base is such that they shouldn't be here for me to filter in the
first place.

>I don't see how they can hurt you in any way. They may actually
> be helpful to some of us here, and help support the Atari community as a

I never used to take any notice of an occasional posting, but he's taking
the piss, its getting to the stage where i could quote the crap he posts. If
it was shorter and less frequent you'd not here from me at all.

(Ben don't take credit cards.)
May be a preference, has reasons, but even I can
accept credit cards now. Paypal sets up a whole new
world of online buying and selling. I mean I could
accept credit cards if I signed up for it, which I haven't.
International credit card transactions may actually be
a problem, I don't know if Paypal will do those.
Just rambling some more.
But I can't see how Paypal (or others I don't know about)
would do anything but increase sales, increase convenience for both the
dealer and buyer, and be secure, pretty much.
I guess there are some problems with credit cards, like
someone cancelling payment with their credit card
company after receiving goods.

Let him do his business. He has a right to post here just as you and I do. And we all have the right to click on whatever message we want to read. I see no wrong in what he's done or posted and it doesn't annoy me at all. In my opinion the more Atari dealers the better no matter what tactics apply.

Ben's an Atarian like us all and I can't see any justification behind badgering him because, well, there aren't many of us out there anymore and there sure as hell aren't many like him out there anymore. It just doesn't make sense to me that everybody ridicules him for having his interests, his hobby, his business which is Atari! For God's sake man! He's on our side!

6609. APE SIO Monitor

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-23 16:56:36 UTC
From: llppwhite@aol.comnsp
Message-ID: <20021123115636.11233.00000125@mb-fh.aol.com>
Source record: 25580

Win APE has a nice SIO monitor, but there doesn't seem to be any way (within APE) to capture the data and print it out. Pressing cntl-C brings up another menu, and a right mouse click brings up a short menu to clear the monitor or "what's this?". Is there another way to get that data from the monitor (not Print Screen!)? (Looked at the DOS docs, but didn't find anything).
Larry

6610. Re: ADV: Atari 20/20 ThanksGiving Discounts! Get them at Bravo Sierra!

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-23 17:12:41 UTC
From: Don Schmidt <dschmidt@pacifier.com>

Source record: 25581
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

You read every message?! And every one of Ben's Bravo Sierra ads clearly states in the Subject line that it is selling something. And yet you read them? Do you read every line? You do know how to skip a message or block a sender don't you? Or are you and those who carry the same attitude have set themselves up as the news group police telling all what they can see and read.

Some of us, myself being one read the Atari news groups for one purpose, to see who is selling what.

Here's a puzzlement: Several criticize Ben's ads because even though he's on topic, posting abut Atari hardware and software, the complainers only criticize. Seems they violate the news group guidelines for being off topic.

6611. SpartaDOS source code and the rtdos operating system project

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-23 18:18:48 UTC
From: rtdos@yahoo.com
Message-ID: <845192d9.0211231018.5d43861e@posting.google.com>
Source record: 25582

Last night I talked to Lance of Video 61 and we discussed rtdos and him letting me use SpartaDOS source code in the rtdos operating system project. It was a pleasant conversation. We know the same people in the Atari community, as it turns out. I was telling him my ideas and stuff about rtdos. He was telling me why he does this or that regarding BBS Express Pro. I understood. I'm not gonna give the full details of the conversation here. But it was one of those conversations that you had to sleep on. Ever have one of those? This was one of those. To sum it up, if I have to sign a legal document to allow me to use SpartaDOS source code in rtdos, then I don't need the source code that badly. That legal document would prohibit me from releasing rtdos as freeware / opensource due to the fact all or even some SpartaDOS source code was used. I'm not gonna do that to rtdos. rtdos is my gift to the eight bit communities as a whole. rtdos has been and will always be freeware / open source.

I'm sorry Lance, but I can't do it. I can't have rtdos destroyed by legalities.

I'm working on rtdos on my free time. That's why there is no solid source code yet to publish. Another reason is because I'm learning this as I go along. Its a great learning experience, not just for me, but for others interested in the project as well. Below is a snippet of what I posted on an Atari mailing list in response to the arguments about BBS Express Pro (from both sides). I am not taking either side and I will not have rtdos caught in the middle:

If this is true, then Lance, Steve, and Bob all need to contact a copy right lawyer. There are different levels of copyrights. Just ask Microsoft & Disney. What applies to Microsoft does not apply to Disney and vice versa. Disney thinks they can copyright the Mickey Mouse character for another 20 years but they can't even though people assc. Mickey Mouse with Disney. As for Microsoft, on the other hand, look at the current court cases. Lance might own the name BBS Express Pro but does he have legal rights to the source code ? I believe that is called intellectual property. Not sure. I'm not a lawyer.
Anyone hear of DRDOS / OpenDOS (orginally from CPM which MSDOS also orginated from) ? I think rather than have rtdos in the middle of something I know nothing about, I'll just pass on obtaining the source code to SpartaDOS & BASIC XE / ACTION for now until this is settled. I'm not taking sides here but I don't want rtdos in the middle of something when its development means a lot more to me than obtaining source code. Ever hear of FreeDOS ? It is an MSDOS clone. If Microsoft was really worried about FreeDOS, they would've sent their lawyers after those guys. I'm gonna let the atari community decide

if they want SpartaDOS readability / compatability included in rtdos.
rtdos is my gift to the Atari community as well as the other eight bit
communities. Everyone who reads this email, please check out the
following links:

http://www.freedos.org/

http://www.drdos.com/ (http://www.drdos.net) (
http://www.drdos.org)

http://www.microware.com/oem_products/op-os9.cfm?MS=Microware%20Enhanced%20OS-9%20Solution
(link MAY wrap)

Lance, Bob, and Steve: There are TOO MANY legal complications here
for me to even use the SpartaDOS source code. My apologies to the
Atari and the other eight bit communities. If I were to use the
SpartaDOS source code in rtdos, then considering, legally, what has
been going on here, I could not release rtdos as freeware / opensource
which is what my plan is. Only because I would be tied to whatever
agreement I sign between Lance, Bob, and / or Steve (or whomever). I
am not and will not have rtdos tied down like that. Because the way
rtdos is being designed and developed I cannot and will not stop
anyone from adding or updating rtdos to include SpartaDOS patches.
Legally, I can't. On the flipside, you have an MSDOS emulator for
UNIX but have yet to see Microsoft going after this person. Make
sense?

I hope to unify the eight bit communities (Apple, Atari, Commodore,
TRS80, etc.) with rtdos. But I will not let anything like this tear
my project apart. That is why I have chosen NOT to include SpartaDOS
in rtdos.

I'm sorry, Lance, but there are too many legal issues here that need
to be resolved first before I can consider implementing SpartaDOS into
rtdos and I am not gonna have rtdos destroyed through legalities. I
may write a command line version of MyDOS and go that route (because
the source code is already out there and readily available), but until
then, I'm not jumping in the middle of this.

>> Fourth, even if it is against the rules, that doesn't make it "off-topic".
>
> What sort of logic is this!. Its against the rules, how off topic is that?.

Let me clarify what I meant:

1. I define on- and off-topic as whether or not a post is Atari-related.
2. Something can be on-topic subject-wise, yet still be against the rules if the rules say the method of posting (i.e. advertising) is wrong in this venue.

So under this definition, something can be on-topic, yet against the rules. I personally feel that his posts are not against the rules, as many people have posted here selling things without any uproar, and people have posted evidence that it is not against the rules to advertise something here. The only difference in this case is that he advertises more often than most, which is apparently the problem you seem to have with it, according to comments you've made.

In my opinion, since we are such a small (and apparently declining) group, we should be able to make some exceptions for people like Ben, trying to get by through supplying us with things we need, rather than being so hard nosed and rule-oriented about it when it doesn't suit our liking.

> I never used to take any notice of an occasional posting, but he's taking
> the piss, its getting to the stage where i could quote the crap he posts. If
> it was shorter and less frequent you'd not here from me at all.

If you can quote the posts, you must be reading them. Why? Just ignor them when you see who they're from. Turn on a filter and you'll never see them. But to some of us here, his posts are good, important, and on-topic. So why not just let it go, ignor it, filter it, whatever. Don't read them unless you intend on seeing what he's advertising. It's really very simple to do. And it's much better than making a huge fuss over nothing. I really don't understand what the issue is with it. With less energy than it takes to write even one of your posts complaining about it, you could have filtered it out a long time ago.

Just my opinion...

I know TopDos from Eclipse had a ver 1.5 and, I think, a 1.5 Plus and maybe a 1.3... It was mostly 2.0S compatible although it offered the incompatible option of deselecting the file number in each sector so they could alphabetize the directory and avoid error #164 unless you attempted to access the disk from MyDos, etc..

I never saw K-Dos, but did see a review of it once in an old Analog or similar magazine.

6621. i need input on the future development of pro, all welcome

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-24 06:01:02 UTC
From: Video61@webtv.net
Message-ID: <23199-3DE06B1E-615@storefull-2114.public.lawson.webtv.net>
Source record: 25593

first off let me say that i hope to never abandon pro for the atari,
but right now someone has made this a tough choice.
i love my atari's and i use them daily, but revenue from pro on the
atari is all but dead, and i do need to pay my bill's.
so what my plans were to do was to develop pro for other platforms
which might bring in enough revenue to pay the programmer's, pay the
bills associated with programming, and to use some of that revenue to
subsidise further development for our beloved atari's.
this would be a money losing venture doing it for the atari, but i love
the machines, and i want to give something back to the atari community
to keep this machine alive.
there was a lot of heated post's on another mail list that i am sure is
a urban legend by now on what a sue happy jerk i am, and there is
nothing i can do to change some minds on this so be it.
but i am willing to lose money on pro in the atari world to give some
here some hope, but i need your input on this or otherwise it will be
doomed from the start.
i cannot release pro to be open source, sorry. there are a few here
that know the terms of the sale to me, and it will never go
pd/shareware/freeware/etc. but it can still be developed for other
platforms, and we will keep the atari in mind as we further pro's
development.
i might need programmers in the future who will be asked to sign a
non-disclosure statement for development work on all platforms, but if
we are successful it will mean further atari pro support.
i also will be doing this with sparta dos 3.3 as soon as some notarized
paper work is delivered to me making certain statements as to the
ownership of 3.3 that was contracted for use with pro, and was to be
distributed only with pro.
my son who put a pro board together at the age of 12 is now interested
in running a pro board again on the net.
we hope to get into the grove again, and he wants to learn pro all over
again, he is now 22.
this will mean hopefully that there will be a place for all pro user's
to come to share information, and yes maybe a little help.
we are a family run business so if this takes a while, or if family
problems arise it might not happen fast or at all so please be patient.
what do you think?
thanks,
lance

i was asking because i remember getting two or three different
versions of TopDOS from B&C a long time ago and was just curious as to
what other versions there might be.

any in atr or xfd format ?

Hello All,

I've just started a new eBay auction, this time for 8 disk-based Atari
software, which includes some very unusual stuff. The link is below:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=803596284

Be sure to check out my other auctions too.

Dean Garraghty

what a bunch of cry babies, all for what?
some ad in this newsgroup.
This newsgroup does not generate half the traffic other groups do.
Get a better newsreader and set the filter button if this monthly ad is
too much for you to handle.
Do you write abc network when Intel cuts your favorite show every 5 min
for their latest P4 commercial? can't even set a filter in that case.

This is a pretty ridiculous thread to be honest and I am quite surprised
it lasted this long.

What would patches would you like to see for SpartaDOS, my suggestions are:

512 or 1024 byte sectors
break the 16 meg HD limit
cd rom support (maybe even CDRW)
zip drives
large memory (maybe upto 64 MEG?)

any other suggestions?

6629. Re: i need input on the future development of pro, all welcome

Hi Lance,

I ran a Pro BBS for 11 years (Star NET node 449) and had many many
users
even your son (JagMan) was a long time Caller. The BBS was ran in
Bay Harbor Island FL (Miami) where I was the only Atari BBS. I was
competting with some veary powerfull IBM BBS's but pro gave then a
run for the money and features.
In 1995 the internet went public and that started the decline of all
BBS's
I continue to run Star Net till 1999 and then took it off line.
These days all those powerfull BBS's on the PC platform are either
Freeware or shareware and not 1 is being sold. The Atari user dont
have such as shareware base or freeware for the BBS's programs that
run on them, the ones that are avalible are a few Basic AMIS
knockoff's and Express 850. These BBS where great for there day but
fall way short to whats availble for the PC. Infact all the
commercial BBS's for the C=64 BBS are now freeware. The owners of all
those BBS's that are now Freeware and shareware still make a return by
selling addon support modules, networking and other util's.
This is probley the way to go if you sell Pro for any platform.
You need to do some research on this.

-Best Wishes-

If I remember correctly Pro V5.0b was programmed around the bat.com
file.
I owne 3 version of the Pro core 3.2 4.0 and 5.0, while I never put
v5.ob online
I did beta test it for months.
I dont think V5.0b would run with out this file due to it programed
around the multiplexer. The owner of Pro (lance) would have to drop
back to a older version of pro for sales.

> I ran into K-DOS a while back when I purchased the libary to a users
group and came across this DOS. Does anyone have any info on it ? Is
it by Bob Klaas ? <

A Google search reveals a couple of references:
Kay Enterprises 1981 and K Dos 1982. It was a command-line Dos, mostly
compatible with Dos 2.0s. I remember a demo of it at a user group meeting in
1982.
It was $80 (Ouch!) at the local Atari store.
The computer part of Kay Enterprises was K-Byte whose major claim to fame was
K-razy Shootout. They released several other games (K-Star Patrol, etc.) and
IIRC, then sold out to CBS Games.

Yes! very impressive demo, I worked with fox on getting it to run on
all real Atari's. When released it would only run in emulation (yuk)
I contacted FOX and discovered that Numen was not loading the correct
memory banks. FOX had a fix in no time and I beta tested it on thses
machines:

130XE (320k) antic pal chip
130XE (576k) antic pal chip
512k XL with antic pal chip

FOX is one of the BEST coders for the 8bit and I want to see more kool
stuff from him.

6636. Sparta dos copyright issue (DEAD)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-25 01:09:27 UTC
From: atari8man9@netscape.net
Message-ID: <4e391c6.0211241709.2a31d778@posting.google.com>
Source record: 25505

With all this talk of Sparta dos and copywrite issue going on these days its just
not true. First I will list all dead items then give some background on all this.

Dead items:

Sparta dos all version!
MIO all versions and os
SDX all versions
OSS carts all of them if part of the ICD deal with FTE

FTE has NOT filed an ANUAL REPORT with the US Copyright office in 8 years.
Failure to file in 4 quarters results in DISOLUTION.

With all the scam deals by FTE its easy to see why the ANUAL REPORT was not filed and
there maybe Judgements on the owner, He can hide behind the corporate shield in most states.

I was the owner of SPEC Publishing corp in the Late 70's-80's and aware of most
copyright laws with Publication.

ANYONE that has bought Sparta dos and the copyrights need to see a Lawer on this issue and may have a case with its seller.

I know most of you guys and dont want to see anyone get burned.

You should try it maybe. It supports batch file type srcipts, powerful
memory access and nice file handling and display possibilities.

rtdos,

What about your screensaver? Or is that what you're referring to?

Hi Lance,

Sounds like a good plan! I know it might be a money losing venture, but if you love to do it why not. Go for it Lance. it's just what the Atari community needs to show those PC's what for :)

As for the BBS, I look forward to the day when you get your BBS back up. Maybe there could be a another BBS or site that could take the place for Pro information, help until your BBS is up and running again? I might know of a few people that might be interested in donating some time and space.

Yeah, I know what you mean. I also run a Pro BBS which is, in fact, available via Telnet - which you probably already know. I had the BBS on a regular dial-up line, but very few callers. Once I made it available via the Internet, I starting getting more calls than I thought I would from all over the world.

Reading more and more of what Pro is and can do, I bet that it would make the PC's run for cover :) This is even more of a reason not to make Pro sharware, freeware or pd. Just waiting for the day when I see Pro available to buy at Best Buy. What do you think about that, Lance? :)

Source record: 25514

here is what sparta dos 3.3 is. first off sparta dos- 3.2g maybe g+ was made shareware i believe by FTE.
but bob klass of k-products contracted FTE for sparta dos 3.3 for use exclusively with the pro bbs system, and was to be distributed only with pro.
meanwhile the person's who crafted sparta dos 3.3 as contract programmers for FTE were not paid for the exclusive dos by FTE.
bob klass of k-products was to be the recipient of said dos, and was expected to pay FTE for it.
instead FTE went under, and bob klass paid the contract programmer directy for the source code that bob had contracted for.
so this dos is not a FTE product, but instead a k-product product.
you might or might not have a point on the other FTE products i do not know and i would not infringe even if it were true, but on 3.3 you are not.
as far as all other sparta dos's are concerned if they are shareware, great do what you want.
i am gathering notarized statements as to these facts, and i expect to prove full ownership rights of sparta 3.3 thru litigation if necessary.

K-DOS is Atari 2.0S compatible. Main additional feature is a machine
language monitor. It was written by a U of Michigan student named
Marcus Watts in 1981.

I don't want to be argumentative.
Michael Current has researched and has a document about copyrights. I wasn't under the impression that copyrights had to be 'registered' every year. Once you've registered it, it is good for 25 years, and renewable for more.
And, if I remember, Michael said that just putting a copyright notice and the 'c' in a circle is sufficient to make the copyright have legal force, even without registering it with the copyright office.

Own the worlds first PDA!

I have a few of these nifty little devices available (As seen in Terminator II, being used to hack an ATM*).
They are all in mint condition, in box, wrapped in original plastic.

Also available are memory expanders, software, and parallel interfaces.

Available at various international websites for $AU310 to $AU490, I'm willing to sell at $AU200 (open to negotiation).

Remember, they *are* nifty.

Email me at jfairhall@DELETETHISBIThotmail.com

*Not Recommended Usage Of This Device.

OK just climbing on to my soap box from my lofty position as one of the largest Atari resellers.....

I been reading the emails " purporting to be from Ben, personally I don't know either gentlemen and to be bluntly honest my sympathies lies with Ben in this manner. Probably because I put a Kill file on his emails I don't read all of Ben's emails.... and this time Steve I don't totally agree with you- I think SPAM is email crap not newsgroup crap. Ben can conduct business on his terms, not using credit cards acceptance will limit him but thats his choice - it is your choice to buy from him and submit to his terms and conditions, as long as they don't contavene local or national standards. The regularity of news posting shows enthusiam to sell, something all we traders have..... did I mention my web pages? link below.... (grin)

The gentleman using the anon remailer obviously doesn't have faith in his convictions otherwise he would be more open to, shall we say, direct contact. But if you read the terms and conditions of the Frog remailer that is not too suprising, personally I have yet to find a really good reason to use a remailer except to hide your actions. BTW a quick transcript is below..

Unpleasant messages on NG
I do not speak more than 6 languages and I am not interested in all the 70.000 NG I have access to, not even their charters. Besides, I feel no vocation in censorship, and I do not read what emerges from the remailer. In addition, remailers are dedicated to allow expression from minorities, even extremist views. (Cf: F.A.Q. (Questions and Answers) <Pol_EN_Faq.html> about most serious matters.) If your case is strong, convince the trouble-maker. If not, ignore him: he will get bored. Do Not Feed the Troll. On the other hand, in case of persistant and obvious annoyance, one cannot emphasize too much the use of individual *filters*, available on all recent newsreaders. That feature will be quite efficient, because most trolls and trouble-makers *love* to sign their deeds, their are craving for any kind of notoriety, whatever dubious.. And broadcast the information *by private mail* to NewB tempted to react impulsively to the loud-mouthed. It is now possible to ask for such messages to be filtered, against their "From:" Write to Frog-Abuse <mailto:Frog-Abuse@nym.alias.net?Subject=Complaint: Please Block A Regular Obnoxious Nick>.
If you want to contact admin on the Frog remailer try http://www.privacyresources.org/frogadmin, but after reading above I don't think you will have much luck.

Hi Russ,

Sorry I mad an error when posting that message.
The Anual Report must be made to a State office to keep the
corperation open.
Once the corperation is gone the copyright is weak, if the Copyright
was issued to a person like me or you then it would be good for 50
years after death.

Hi Russ,

Forgot to reply to the last part of your message
Michael is correct in that the copyright starts at the moment of
creation
and there is SOME grace time to register for a copyright.
I closed my Publishing corp down more than 20 years ago.
I had copyrights that was published by my corperations stollen after
the corp. was no more and could not take action, on the other hand
anything that was copyright by me was never touched.

Most ABBUC Members are germans, but ABBUC has members all over the
world. We speak english too, so this should be no problem.

You find more information on this contest on the pages of the ABBUC
Programmers Group, http://www.strotmann.de/twiki/bin/view/APG/WebHome

There is also an english description of the contest rules and you can
get ideas for programms from the IdeaPool Page there.

Aw, do we have a gay fixation because of something that happened at
home?

Were you badly 'reared' by your Pa.

Posting by anon aint clever son, you aint very bright slinging names
like a kid but you are a coward hiding behind a remailer like the drop
of man juice you are..

Go on, post these using the address you normally use in here. Oh but
that would mean being a man and talking face to face while taking the
come backs of your actions which clearly isn't something you have the
balls for you wimp..

> I ran into K-DOS a while back when I purchased the libary to a users
group and came across this DOS. Does anyone have any info on it ? Is
it by Bob Klaas ? <

Gee, that's odd. I added text as an answer, but only the first part made it to
the post... Anyway, Ill try again...

K-Dos was by Kay Enterprises ~1981. It was a command-line dos, mostly
compatible with Dos 2.0s. The software portion of Kay Ent. was K-Byte, whose
major claim to fame in the Atari world was K-Razy Shootout. They released
another series of games K-Star Patrol, K-Razy Antiks, etc. then IIRC sold out
to CBS Software. We had a demo of K-Dos at our users' group meeting in 1982.
It was $80 at our local Atari dealer. (Ouch!) I did not believe it compared
favorably with OSA+ from OSS.

Well indeed. Apart from anything else, I do wonder about the mindset of
people who can get so angry over such a trivial thing and it IS a trivial
thing as many others have pointed out. The rubbish written about it far
outweigh the original postings. Sure, there are numerous Ben postings but
it takes what, half second to read ADV and skip to the next message? If
your life is that busy you can't afford half a second a week, I'd suggest
Ben's postings are not where you need to focus your attentions.

Howdy folks

I'm loking for Guy ferrante. He mentioned the following:

"Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
It now 100% stable works with all Dos'es and fixes the 10 second
delay when rebooting. (I will publish the fix soon - Guy Ferrante); "

I'm interested in the '10 second delay when booting' fix as I hope it will
work on other upgrades too.
Has it been published already? Will it be published soon? (how soon?
-))

have a few >ABBUC magazine's demo's and wondered if the magazine is in
German or English ?

Oh sorry, I misunderstood. ABBUC is short for Atari Bit Byter User
Club e. V., a A8 Computer Club with a Headquarter in Herten, Germany.
ABBUC has about 400 Members today. The members getting 4 regular
Magazines per year (on disk and paper, ~40 pages) as well as 2 Special
Magazines and a christmas gift. There is also a Diskdrive and Computer
repair service for members, a big PD-Library, and much more.

We're working on a relaunch of the Clubs homepage,
http://www.abbuc.de, the relaunch will happend end of 2002 / beginning
of 2003 (we're working as fast as we can). There will be more english
information available on the new page.

To subscribe send an email to Wolfgang Burger, the head of Abbuc -->
wolfgang(at)abbuc.de

He will provide you with all information to get into ABBUC. To
translate all content of the magazines into english will be a major
task, i fear we have not enough people to volunteer.

>I'll check out the page you linked!

coding >demos ? I would really like to get back into the coding now,
since my wife left >me, I guess I'll have some spare time soon. I
coded about 10 demos or so back >in the late 80's I think it was.
Under Hawk and Pokey Soft! My main problem is >that I suck at graphics
and music, well, maybe I suck at coding too, but I was >happy with the
results myself. They are downloadable at :
>http://games.nmi.no/atari/a8dl.htm if you want to comment on them.
Works only >on PAL machines though!

As I wrote the ABBUC has about 400 members, from which I think are ~350 from germany. I think there are about 800 Users still in germany, about 100 active in ABBUC and about another 100 active elsewhere (other regional clubs, not organized). Yes, there are still new demos (look at http://www.strotmann.de/atari/abbuc/bos/2002/index.html, where two new demos are shown during the "Best of Show" Contest) These demos will be published on the next abbuc magazine. You may request them from the authors. There are also some new games.

I will take a look at your page and the programms. If youre looking for a team to programm new demos, you can open a new topic at the ABBUC Programmers Group Demo Coding section at http://www.strotmann.de/twiki/bin/view/APG/WebHome

Ciao

6659. What the hell has happened to the Atari community ?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-25 15:30:35 UTC
From: rtdos@yahoo.com
Message-ID: <845192d9.0211250730.7ca42fb8@posting.google.com>
Source record: 25530

Between the Bravo Sierra fiasco and this BBX Pro crap, what the hell has happened to this community ? Is it Ben's fault ? Maybe or Maybe not. Is it Lance's fault ? Maybe or Maybe not. I am not and will not take sides, but want to know what the hell happened to this community. Did we all get greedy or what ?

I'm doing rtdos because I want to. It is my gift to the Atari community. As it stands, it has been and will always be freeware / open source. rtdos, I hope, will be supported by the Atari community itself as well as the other eight bit communities. Right now I am working on rtdos in my own free time. It will be developed when I have the time. I hope that rtdos will unify the eight bit communities and allow our eight bits access to today's technology such as 80Gig HD, DVD/RW, 512Meg RAM, USB, etc. But don't expect a miracle.

Within the next 5 or 10 years, parts for these old machines (or the systems themselves) will be increasingly harder to find. I don't know about you, but I've invested way too much time money and fun into my eight bits to see them fade away or donated to the smithsonian. If we can't preserve the horse, maybe we can preserve the cart.

Source record: 25534

That's true, Richard, but if you think chaos is a tradition that's LIMITED to the Atari community, you have another guess coming.

I think that newsgroups, mailing lists, just about any kind of forum degenerates into this kind of chaos from time to time. It gets personal, it gets annoying to those who lurk and don't participate, and it forces some people to pick up their marbles and go home. It's not pleasant to see. But I've actually seen positive things result from clashes like we've recently witnessed here. There was one case I witnessed (I won't mention the community -- there actually may be many like it) where the protagonists were actually saying the same thing in different ways. When they finally cooled off enough to let somebody else explain that to them, they agreed to cooperate and a major piece of progress resulted.

That just might happen here, if we allow things to work their way out.

Take care.

Alan

The rtdos project sounds interesting. It sounds like something I'd
like to work on, if only I had some spare time. The problem is that I
couldn't get any busier with everything I'm juggling now. I even had to
resign as an active team member on the real dos project because of this.
Of course, I'd be happy to act in an advisory capacity as long as all it
takes is just a few occasional emails.

Best,
Tom

A little unfair imho, there have always been retailers of refurbed /
re-released material and I don't begrudge a single one of their
living. I myself have had chats with Ben and Lance re their sales
practices in the past but I respect their dedication to the community
100%.

My initial beef with Lance was if he was getting authority to publish
these titles which he happily confirmed to me and with Ben I didn't
like his stance on Ebay BUT where the community is failing is by
devoting too much time to the destroyers of the dream.

We all love our Atari's and in a perfect world we would be happy to
see whatever work we have done enjoyed by the happy masses but since
we all need to live some make a living from the Atari. Surely we all
agree that not every thing comes for free no matter how nice the
notion is.

I salute all that give their free time to making new items, thank you
, we all appreciate the work and it's more important than anything
else.

As for those that seek to attack the community with stupid snide
emails etc, grow up. You are not as invisible as you think you are and
in the end you really are doing more damage to what you claim to love.
A person's point of view is important, those that have problems should
make them known in a civil manner, anything else is more destructive
than that they moan about.

Lets get back to the thing we love....

It grieves me to think that this game might never be released. I think
that Fox should release it with only one or two levels and the tools
required to design/build additional levels. Let people play what is ready
now, and compile more levels as people build them.

I for one am very bothered by the idiocy (not that I'd call ben or lance
idiots). But if you think this is bad take a look at the ST and a few other
newsgroups. At least yourself and a few others are making good
contributions. If we could do more of that and less arguing about bollox
we'd all be better off

6675. Re: Sparta dos copyright issue (DEAD)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-26 04:32:25 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3de2f95e$0$1456$272ea4a1@news.execpc.com>

Message-ID: <u6DE9.55251$Gc.1297970@twister.austin.rr.com>
Source record: 25597

Well, I may not make a post everyday but I do read the posts daily (nightly). It's very entertaining at times, kind of like a ping pong match. I for one have no problem with heated debates, I'd rather see that than a dead bored newsgroup. As for the vulgarities, that's just the nature of the usenet and as offensive as I may find it, I would never say don't do it because it's that kind of freedom that built the usenet. I was amusing to myself at how much more action my Atari sees today than it did in 1981. I had a modem back then but it was only Compuserve (very expensive might I add), no-one ever told me about bulletin boards and for the most part my machine was nothing but a game console. I think because of the freedom of the internet, surviving software (due to piracy), and this newsgroup- the Atari community is probably aliver than it ever was even though the company's long gone.

Rambling like Russ does...
Mo

hi guys,
Digging up info on one of my first computers,
It was definitely an XE and was bought around 1988 in the UK
I think it was an 800 if they were available there if not it may have been a
130 or 65??
But definitely an XE from browsing the web and looking at the styles.

2 questions for you...

1)Where can i get one from desperately ??
2)Does anyone know the retail prices for them at the time of release
65XE
130XE
800XE

Hello,

I can think of sector caching in extended ram. Like smartdrv in old
ms-dos.
So on each call to SIO-Vector, a routine inside dos checks if the
sector is already in externded ram. if not, it will read from disk and
placed into extended ram. if yes, it will be fetched from the extended
ram.

Possible Problems:

a) how to detect a diskchange on standard 1050/810?
b) need for programming rules on how to use the extended ram with more
than one pgm (like ems or xms api on M$-DOS)

Hello All,

I just found an article at Optimum Online's Web Site from the Associated Press.

Does the name Alan Kay mean anything to anyone here?

Alan Kay was chief computer scientist at Atari from 1981 to 1984, and he's just joined Hewlett-Packard Labs as a senior fellow at age 62. He'll be working on developing new software platforms, the underlying code for which will be distributed as open source, a la Linux.

The article said that Kay had a role in developing ARPAnet in the '60s, was at XEROX PARC from 1972 to his stay at Atari. He developed the forerunner of today's notebook computers, invented Smalltalk, and played a role in developing bitmap displays.

After Atari, Kay worked as a fellow at Apple until 1996, when he joined Walt Disney Imagineering. He left Disney last year. His current projects include Squeak, which is a programming language for children that relies on images instead of words.

How many of us can boast about starting a new job at age 62? Heck, I'm 62, I've been retired from teaching for more than six years, and I'm not about to quit now!

Take care.

Alan

From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <as0dbg$4fk$1@reader12.wxs.nl>
Source record: 25619

It is spartados compatible indeed.

I'm using BeweDOS on a 16mb partition right now with myIDE.

I had to trick the partition a little. First I formatted an empty ATR image (65535) sectors. Saved the XBW130.DOS file on it, and then made that partition bootable.

Last but not least I copied the first 37 sectors to the MyIDE 16mb partition. And there it was... the 16mb partition... spartados compatbile with MyIDE.

Hdinit (from spartados) didnt run with bewedos/myide ... nor did the fmtdir.com software from Bob Puff for the black box. So I had to do this trick.

6696. Re: Which 256 upgrade - Rambo or Newell?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-26 18:12:50 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DE3B9A2.90BF7023@students.uni-mainz.de>
Source record: 25615

Well,
both enhancements/upgrades exist in more than one form, for example
Newell is available as 256k upgrade (64k RAM + 192k RD), as a 1MB
upgrade (+1MB-RD), as a 4MB upgrade (+4MB-RD) and also as many selfmade
"compatible" upgrades. Rambo exists as 256k upgrade (64kRAM + 192k-RD,
the same as newell!) and as a 512k upgrade. As you see the 256k Newell
and Rambo are compatible to each other, so the main question would be:
How much extra RAM do you need ?!? Besides, I don`t know why the Atari
800 Emulator calls one 320k setup "Compyshop" (which is ok, they do
exist in that form!) and the other one "Rambo" (which did originally not
exist in a 320kbyte form)... -Andreas.

6697. Re: MyIDE tool 1.1b ready to test

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-26 18:20:52 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DE3BB84.1A970C97@students.uni-mainz.de>
Source record: 25616

Hello,
by the way MyTool can be streamed and shortened a little bit. Afaik, Marius used a Basic compiler to compile the Basic listing. Most, if not all Basic compilers (except the TB compiler!) tend to create more segments than nescessary. for example if you have segments like 2000-2fff, 3000-3fff,4000-4fff,5000-5fff,6000-6380, run 2000 - then you can "stream" or shorten them into 2000-6380, run 2000; and save a lot of extra/surplus segments and bytes. I did this with Marius MyTool and saved some 900 bytes and over 200 segments!! How? Simple! - I used the Streamliner program from antic or analog magazine. Right after that I used the Flashpacker and packed the program from 182 to 114 sectors. It still works fine... -Andreas.

P.S.: E-Mail me if you are interested in the Streamliner program or any packer programs...

Yes,
but even the "8bit-boerse" did not have many more visitors than those
Atari-only shows. It would be somehow strange to see a show with over 50
vendors and only 40-80 visitors...
-Andreas.

6699. Re: Taquart - Numen Demo

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-26 18:31:26 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DE3BDFE.562DB0DE@students.uni-mainz.de>
Source record: 25618

Well,
the TIT-Demo from Madtream (you don`t see any tits there!) has also 2-3
great parts, The Journey Demo from Polynomials is very nice (but needs 4
disksides!), Asskicker and Trip 6 from Shadows are also good demos, as
well as Timekeep(er) by NG and Sheol by BB (they both need 8ACE
RD-blocks!). Other demos of interest (to me) are Khai-et by AIDS,
Impossible but Real by Mac Gyver/AIDS, The Bill-Pie Gr.9-Demo (someone
throwing a pie at Billy Gates!), The Worms-Gr.9-Demo (intro of the game
"Worms", something that lacks the Atari Jaguar cart!) and a few more
demos. Of course the good old XANTH demo is also very nice...
-andreas.

6700. Re: DOS 2.5 Command Processor by CHAOS Software

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-26 18:40:36 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DE3C024.5DF391C0@students.uni-mainz.de>
Source record: 25621

Well,
I only have one version - and it looks like this file merely works with
DOS 2.5 (and no other DOs). Besides there are also other DOS 2 Command
processors - I have 3-4 in my collection, but never used them. I guess
the best known one is the CP by BBK (Bryan Schappel and Barry Kolbe)
released in Analog Computing... -Andreas.

Well,
there is also DOS II+D by Stefan Dorndorf, if you need a command line
DOS. Version 4.5 is for Single and Enhanced, Version 6.1 is for S+E+D
(but enhanced is not DOS 2.5 compatible). Both DOS versions are PD!
Version 6.1 (or the patched version 6.4) also supports use of
batchfiles, which you can see in many polish demos, like X-demo, Igor,
Timekeep and many others...

At the moment Stefan is still working on X-DOS which will at least
support S+E+D+Q (up to 360kbytes), but *maybe* also higher formats and
subdirs. X-DOS is DOS 2 and DOS 2.5 compatible (you can select if you
wanna have Enhanced density in DOS 2.5 or in MyDOS mode!), but uses a
command processor. It also supports Batch-files and an XF551
speeder... -Andreas.

Hi,

What to put inside PRO:

1) Message base limit of 32 to 255
2) File base limit from 32 to 255
3) zmodem download/upload
4) real internet gateway software for PC/Atari ST-TT-Falcon030 and/or maybe MAC.
5) import / export usenet format
6) maybe when possible support higher speed 38400 or 57600 the blackbox can be modified for this and it works.
And more... maybe some other sysops like Fox-1 / Marius can add somethings...

would you mind emailing me these? I'm looking for a command line dos
that i feel comfortable using with an emulator such as Atari800Win
Plus 3.1

While I have the utmost respect for those still trying to make a
living working with the Atari, I think putting any further
effort into a dying software genre (BBSs) could not ever
be profitable. If you are doing it as a hobby, that's one
thing. Back in '95-'96 I started running BBS. I started under
OS/2, but then decided to look at a dedicated solution. Even being
a Atari fan, with multiple computers, I decided to pick up a cheap
386sx and a copy of Red Hat 3.0. The result was lot more flexible
and powerful than any BBS software could hope to be.

Anyway, more power too you, but I don't see how you would
recoup the time and energy put into it.

Hi Ben

> I believe most who have decided not to buy from me have Pre-Judged me.
> Another word for Prejudice. Most of you have not given me a chance to
> serve you.

The fact that you choose to ignore criticism says to me that if a customer were to have a problem you would treat it in the same manner, by ignoring the complaint. Your attitude in here speaks volumes as to your attitude to customer relations.

> Those who want to crucify me over spam need to evaluate this on a case by
> case basis. Judge me on my merits, not on a one-size fits all. Don't throw
> out the Baby with the Bath Water!

A public acceptance that you yourself agree that its spam, that will thwart you defenders.

BTW, do you realise that some of us have to pay to download your crap.

I think that anyone with anything to say should do it as we are, using real
names and email address that can be replied to.

> Probably because I put a Kill file on his emails I don't
> read all of Ben's emails....

So you've obviously been offended by this shitte at some time.

> and this time Steve I don't totally agree with you- I think SPAM is email
crap not newsgroup crap.

That's really besides the point, its against the local rules, besides, its
his whole attitude to potential customers that pisses me off, I've requested
a number of time that he curb his mailouts and I've never yet had a
response, you all seem to forget that at one stage we'd have to wade through
about 30 Atari message bases to kill his crap, do you call that reasonable
behaviour, if you conducted business that way then I'd soon be down to
Rochester to piss through your letterbox, never to open my wallet and peruse
your endless Atari packed shelves again.

>Ben can conduct business on his terms,

No he cannot, there are rules, put in to prevent this sort of abusive
practise.

> The regularity of news posting shows enthusiam to sell, something all we
> traders have......

It show nothing but a blatant disregard for everyone that isn't pro Ben

>did I mention my web pages? link below.... (grin)

What, this one?. My that's unobtrusive and completely inoffensive and also
quite reasonable.

Hi,

There are many many great Atari demo! I like SHEOL,X-Demo,The BIG
demo,Timekeeper, Sweet Illusions and many many more.
I want to see new stuff by the MAD TEAM (there great!)and Shadows its
been a while since they released anything since Trip6. I still watch
some older demos like the TOP 3! Great stuff by WFMH.

Nevermind the fact that it's very easy to trace the point of origin of any person going through an "anonymous" remailer by having the right contacts and knowledge. The internet is a huge paper trail that reflects your decisions, good and poor.

Atari released the Dup.Sys source, but I have never seen it... Compute!
published "Inside Atari DOS" from OSS, Shepardson Microsystems, Bill
Wilkerson, etc. which included the Dos.Sys source.

Hi,

Im at a lost trying to get your point when you say Pro will make the
PC run for cover? While its a nice thought, you realy need to stop
smoking the cheap stuff. First of all ALL third party support is gone
for good. Back in the 90's there was the best Atari programmers
writing mods and updates for pro but its all gone now. I love Pro BBS
and know it like the back of my hand and may someday even put the
ALLMIGHTY Star NET back online. Star NET was ran on 3 upgraded Atari
XL 1}1088k 2}512k with 500 megs of storage (Multi-line) I put over 500
hours of programming into the software alone. All this power with all
these Atari still cant out-do 1 cheap $25.00 386 pc running the FREE
Wildcat BBS.
Im not going to steer the Atari users in the wrong direction and will
never do so. This is what Pro is: Its the most powerfull Atari BBS
program, it runs like the Big rigs on the PC and it run on our beloved
Atari 8bit.
Unless you live in a remote area the BBS scene is dead on all
platforms.

Sure I would like to see Pro support return but its not going to
happen K_P chased away all the Atari gru's years ago. And when I say
chase them away I mean with lawsuits, strong-arming them to turn over
there code or be sued etc
it was an ulgy mess, then K-P was not making money with Pro and K-P
had a Blow-out sale for $15.00 a node and then after that was over
dumped it on lance.
{Sorry Lance I feel they took advantage of you}
But anyways I still love Pro and will allways remember the good old
days.
I strongly think that if Pro was shareware this MAY bring back some of
the old time Atari programmers and all the Atari folks will have
downloaded it and set it up on the 8bits, while Lance could sell the
stuff like the OUTSTANDING Pro-Term, Highspeed Networking cmd's and
the Powermain cmd. Anybody that wanted to put there BBS's up would
buy those awesome util and Lance would make money.
Thats what I would do if I owned Pro but I do not.

Hi Lance!!

The stuff I would like to see in Pro, that I told K-P in 94 was Good
documentation for starts, there's a ton of cmd's that are not
documented at all.
I also wanted these features:

Zmodem for file transfer (16bit crc is perfect)
A QWK door for offline message reading (All PC boards have them)
A gateway to the internet (telnet)
An AUCTION Door! (like a small ebay) Can be done its just a
database
ANSI in the Message bases is a MUST!

While the list is not that big, those features would make people stop
and look.
the AUCTION door will let the Callers make a few buck! and have them
calling back. Zmodem can be done easy by just having it drop down to
16bit crc (like Ice-T dose) the QWK door for DL pre-packaged messages
for offline reading lots of people dont have the time to read every
message on the BBS but with a QWK door they can at there own time.
ANSI in the message bases is not hard either, this can be done by
breaking up the base.cmd in to 5 cmd to do the job and its not to
hard.

What do you think lance?

I recently received this email, and am still trying to figure out if its for real or if someone actually wants to ask such a question. The sender's name has been omitted to protect the innocent (or guilty as the case may be). I'm also trying to think of an appropriate witty reply. Maybe something like... "Well, no actually. But it would work the other way around: burn the eprom (any one will do...) into the processor (just cut off the extra pins so it will fit in your burner). Put it all back together and your Atari will never execute a legal instruction again."
-kinda low on patience today.

Unfortunatly Jiri is not online (to my knowledge), and I haven't found
any webpage. I will start one when I find some spare time next week.

His mail address is (from BEWE Dos Docs):
Jiri Bernasek (BEWESOFT)
Na Hrebenkach 42
150 00 Praha 5
Czech Republic

Maybe there is someone on this list with more information. I think
there are some other A8 User in Praha who know Jiri, have eMail and
can contact him.

you can find BEWE Dos at
ftp://ftp.spudster.org/pub/atari/CTH/Utilities/DOS/BeweDos/

6742. Re: connecting my atari eight HD (thru MIO of course) to PC

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-27 22:30:13 UTC
From: The_Shadow@pdx.cc
Message-ID: <3DE5481A.2A737377@pdx.cc>
Source record: 25463

Greetings Ron!

Unlike the PC, the Atari is willing to send the carrier, then the PC
only does a normal ATA answer command. I generally use BobTerm, if that
helps. Again the trick is to do the send carrier from the Atari end,
the PC doesn't seem to want to do that.

The Shadow

I've placed 3 orders with Ben so far, all were quite satisfactory
and he saved me alot on shipping. He also called me with his own
nickle. I do killfile the ads, it's not so hard.
I don't understand why others simply can't manually skip the ads
or killfile them. I know where Ben is, if I need something I go
to his site and order it. The whole thing really is a non-issue.

So this would be used as a Host to connect the Atari to USB devices (like keyboards, mice, joysticks, cameras, hard drives, etc...) ?

What types of devices is Guus/people thinking to access from the Atari?

I've been reading a little about USB and it is very software intensive, especially for the Host, since you need drivers for all the classes of devices as well as the basic control stuff. It's a neat idea though, I'm going to look into building one and messing around with it early next year maybe.

On the Pooldisk in the stack directory you can find the file
recdos25.atr. This seems to be a reconstructed source of DOS 2.5 in
Mac/65 format, appearantly created by Rob Bishoff.
Probably some disassembly commented.

Keep those XL's/XE's humming.
Ernest.

Im getting ready to relase the 512k XL upgrade that works.
As some of you allready know the 512k upgrade on the British underground dont work, cheer up cause I have the fix. It also fixes the 10 second re-boot delay that Rambo has. The Upgrade is easy and its only 1 chip plus the 8 extra rams. You will also need a Fully working Rambo computer or the Claus Buchholz.

Stay tuned!

6751. Inside Atari DOS on the Web

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-28 06:50:52 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-FB8460.22513827112002@news.west.cox.net>
Source record: 25472

The full text of the classic book Inside Atari DOS is now online at AtariArchives.org. The book was written by Bill Wilkinson, founder of Optimized Systems Software, a company that created many great programming tools for the Atari 8-bit computers. Due to copyright restrictions, the site includes the full text of the book, but does not include the actual DOS 2.0S source code as in the physical book.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Howdy Shawn

> So this would be used as a Host to connect the Atari to USB devices (like
> keyboards, mice, joysticks, cameras, hard drives, etc...) ?

I guess so. I don't know that much about USB, I just knew we needed. Most printers nowadays don't have centronics connectors anymore.

> What types of devices is Guus/people thinking to access from the Atari?

Guus was thinking mainly about the printers (I talked him into developing it). I was thinking aboput just about everything you can hook to it. Starting with printers and webcams. But the ability to network with either more Atario's or even a PC (as a replacement for the SIO2PC cables) would be nice to have too.

> I've been reading a little about USB and it is very software intensive,
> especially for the Host, since you need drivers for all the classes of
> devices as well as the basic control stuff. It's a neat idea though, I'm
> going to look into building one and messing around with it early next year
> maybe.

I re-sent your previous message in which you volunteered for this project to Guus. He could find your old message. I'll forward this message to him too. So he might contact you.

Not obvious at all - he merely said he had killfile'd it so he didn't need to read them. He said nothing about being offended. TBH if anyone gets 'offended' by one of Ben's posts I'd suggest they need to look inwards first...

> behaviour, if you conducted business that way then I'd soon be down to
> Rochester to piss through your letterbox,
Might I suggest some anger management courses then?

No, unfortunately it isn't, a 2764 is two pins (i.e. one row) too large.
You require an adaptor. Whether it is a NCR 2364-30 I don't know.

So long,
Thomas

I would have to say ATR since I see it more often than most. I
however use the DI image format. I just convert the ATR images or
else make my own DI disks....

6770. Disk drive repair

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-28 20:50:01 UTC
From: David Pochron <dpoch@ticon.net>
Message-ID: <as5vhvjss1@galileo.ticon.net>
Source record: 25491

Anyone know of a company that still repairs old Indus drives? I turned mine on last night for the first time in a few years and now all that happens are the track LED lights flicker randomly. I tried taking the whole drive apart and then put it back together again looking for loose chips or ribbon connectors but no such luck. Since the same thing happens whether the mechanism is connected or disconnected from the drive mainboard I guess there's a blown chip or trace on the mainboard (i.e, with the Z-80, controller, and EPROM) somewhere. Alternatively, is there a supply of replacement parts that anyone knows of?

Alternatively, I suppose I don't really need the drive; I wrote a spiffy program to emulate an Atari drive on my Amiga (the Amiga provides + and - 12 on the serial port so I didn't have to find some obscure 5-to-12 volt conversion chip like other drive interfaces use and could use standard TTL-to-RS232 driver chips from Radio Shack.) So I could just use my DOS box to get the data off my disks and put everything on the Amiga drive emulator. BUT... I have yet to find a program that reads single-density disks on the PC. (Double density's mostly work fine.) Has the "can't-read-signle-density-disks-with-the-PC-floppy-controller" problem been solved yet? I tried AtariDrive and AnaDisk to no avail.

If you found someone it would be expensive. I would try GENTLY prying the chips slightly up and then pressing them down again to break any oxidation on the pins, that tends to revive alot of old electronics.
Be careful though, they're easy to bend and break!
Mo

Kevin;

It may not be *that* important, but the info in Chap 2 and the chart concerning the sector links and byte counts is precisely direct from the book and completely incorrect. The byte count is actually in the last byte (# 127 or 255) and the file number-forward pointer link are in the two bytes before that. I really don't know what type of editorial note would be appropriate.

> nice to have too.

The nice thing about SIO2PC (vs., say, a cartridge solution like this one sounds like) is that the Atari doesn't need to do anything special to talk to it. SIO2PC and APE connect to the SIO port on the Atari and emulate standard peripherals.

With something connected via the cartridge slot, there'd most likely need to be some software (booted via the cartridge itself, in a ROM, or booted off of a disk, or perhaps place in a replacement OS ROM) that would know how to talk to it. (Not unlike the MUX cartridges.)

This would no doubt conflict with various assortments of software out there.

Cool idea, though.

Hehe - I assume you were answering the "which is considered the standard"
question, and not the "which offers the best compression ratio" one. ;^)

Howdy folks

Let's make one thing clear:

YOU DON'T HAVE TO BE AN ABBUC MEMBER TO PARTICIPATE IN THE PROGRAMMING CONTEST.

But everybody's welcome to join. It helps if you speak atleast a wee bit of German as the magazin is in german, but most people speak at least a little bit of English.

Well, the Sio2IDE interface version 4.0 has a USB port too. Maybe that can
be used as some kind of SIO2PC interface.

Undecided, perhaps if there is no new(er) tech Atari 8-bit clone anytime
soon.
If no such machine happens then I'd go for an AmigaOne or a C1. But I'd have
little attatchment to either. I went from Atari 8-bit to Amiga in my younger
days
bacuse I had designer loyalty, not brand loyalty.

While changing some lines to make BOSS-X full compatible with BeWe-DOS, I have a problem: there seems to be no XIO-command to set a default directory (D1:). In MyDOS, it is the function 'XIO 41,#1,0,0,"D1:Programme>Spiele01"', that makes, that "D:" (without drive-numbers) will point at exactly this dirctory. Is there a function in BeWe-DOS, that does the same?

Following that line of reasoning... We 8-bit Commodore users should have gone to the Atari ST rather than the Amiga. Personally, I was saving for an Amiga when Commodore discontinued the C128. As I saw it, Commodore had no loyalty to their users, so deserved none in return. I upgraded to a PC instead.

I still use my C128 to run a small BBS, but do most of my other computing on the PC.

6794. LED Resistors?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-30 03:29:25 UTC
From: llppwhite@aol.comnsp
Message-ID: <20021129222925.03090.00000129@mb-bd.aol.com>
Source record: 25414

I've been adding some LED's to a few drives, and in all the project info that I've seen, some type of a current-limiting resistor is recommended. But when I have added a (typical) 1/4W, 100 Ohm resistor, the LED's get really dim. I've hooked up a few to test directly to a +5V source, and they don't seem to fail (for several hours in test, at least). Do many/most LED's have enough internal resistance built in not to require added resistors? Is there some way to tell how much (if any) added resistance is required?
Thanks,
Larry

Hi Mirko. I'm not sure about BeWe-DOS, but in Sparta x3.x there is no equivalent. You should always specify the drive number in your program. But there is an XIO you can use to change working directory:

XIO 44, #IOCB,0,0,"Dd:path"

After doing this you can reference the desired drive without an explicit reference to the path. So

DIR Dd:

would show the contents of the path specificed in the first step. The IOCB must first be closed.

Another technique is to copy the desired command-line string in to the LBUF buffer, set BUFOFF to zero, and do a JSR VXCOMLI. The trouble with this technique is that there is no published global error variable to examine after returning to your program.

Best,
Tom

It's even required.

I usually use 560 Ohm for 12V source and 220 or 330 Ohm for 5V source.

> (for several hours in test, at least). Do many/most LED's have enough internal
> resistance built in not to require added resistors?

They do exist, but usually no internal resistor is used.

> Is there some way to tell
> how much (if any) added resistance is required?

Only if you know the current a LED requires. I typical red one uses about 30mA at 1.5V.

Remember you can buy constant current LEDs (at 5v and 12v) that require no series resistor as they have built-in regulators.

I've been a druid myself for about the past 15 years (seriously). I've always thought druidism is very much like budhism in a lot of ways, yet in most ways it's completely different. I guess I don't really know enough about budhism to make any real statements. I know that both of the philosophies predate christianity by thousands of years, which to me says alot.

It is my cultural heritage so I observe a few of the Christian
holidays, but they have no religious meaning for me. I never found
Christianity relevant to me, so I've never "given up on it".
Generally, I found its liturgical features overcomplex at times and
require excessive suspension of disbelief, so it was never appealing
to me. The particular sect I'm involved with also makes a variety of
claims that it is possible for me to not take a position on yet still
maintain a viable and I hope, sincere practice.

I depend on buddhism in all sorts of ways on a daily basis. The first
principles and meditations are a welcome solace when I am conflicted
and upset. It makes me a better person and a better husband. Beyond
that, its a very personal thing, so I'd rather not get deeply into it
at this time.

I would like to stress that this is only a personal opinion, and if a
particular religion works for someone than more power to them.

Since you are taking data, what have you found so far?

Hello All,

I've just started a few new Atari 8-bit auctions on eBay:

Atariwriter Plus on disk:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=804183219

130XE Handbook (Century Communications - a UK book):

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=804183412

Advanced Programming Techniques (Atari XL/XE book)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=804183657

I have some other auctions still running, including the very rare Page 6
magazine Issue 1, so be sure to click to see my other auctions.

I have lots more stuff due to be auctioned, so keep an eye out on eBay.

Source record: 25427

The clock has been ticking, and my recent checks show that the major makers of floppy media have now quit supplying any type of 5-1/4" media. (I'm not saying that it's terribly hard to find right now, but it is getting scarcer by the month.) Headed right behind it is Low Density 3-1/2" diskettes. There are manufacturers that probably would be willing to make limited runs of 5-1/4" or 3-1/2" diskettes, but then purchasers would likely be facing $1 or $2 disk prices, pehaps for unbranded disks.

I know from past threads that some folks don't believe that there is any real-world difference between LD and HD disks, and for some brands that is *close* to being true. I would also be the first to say that the degree of difference is nowhere as much as with 5-1/4" diskettes. (Just how good did you think those "bargain" disks were in 1985? ;-) In my experience (FWIW) double density applied to 3-1/2" "name-brand" diskettes is as good as it gets from a data retention standpoint. I've also had very good luck with single density on 5-1/4" disks, but certainly not double density applied to 5-1/4" disks.

So, there is something of a problem still headed our way (ever closer). It strikes me that a fairly easy solution to this 3-1/2" storage issue might be a modification to a 3-1/2" mechanism to allow manual selection (a switch) of the higher write current needed for HD disks. Getting a little fancy, it could also be tied to the HD "hole" so that one couldn't accidently write with high current to a regular (LD) diskette.

Before I reinvent the wheel, has anyone looked into this before?

Larry

Glad you asked :) I hope you find the below useful. It's something I put
together with the intention of reconciling the teachings of the Buddha and
Jesus. It's an interesting read.

The Father :

Still they called him by his name and addressed him as "friend Gotama." When they had thus received the Blessed One, he said: "Do not call the Tathagata by his name nor address him as 'friend,' for he is the Buddha, the Holy One. The Buddha looks with a kind heart equally on all living beings, and they therefore call him 'Father.' To disrespect a father is wrong; to despise him, is wicked. The Tathagata, the Buddha continued, does not seek salvation in austerities, but neither does he for that reason indulge in worldly pleasures, nor live in abundance. The Tathagata has found the middle path."
-- Excerpt from the Sermon at Benares
http://www.tbsn.org/ebooks/life/benares.htm

The Father had a plan in mind for us. This is evidenced in the conversation he had with his close companion and attendant Ananda, shortly before his passing away :

Ananda's Appeal
48. The Venerable Ananda spoke to the Blessed One, saying: "May the Blessed One remain, O Lord! May the Happy One remain, O Lord, throughout the world-period, for the welfare and happiness of the multitude, out of compassion for the world, for the benefit, well being, and happiness of gods and men!"
49. And the Blessed One answered, saying: "Enough, Ananda. Do not entreat the Tathagata, for the time is past, Ananda, for such an entreaty."
50-51. But for a second and a third time, the Venerable Ananda said to the Blessed One: "May the Blessed One remain, O Lord! May the Happy One remain, O Lord, throughout the world-period, for the welfare and happiness of the multitude, out of compassion for the world, for the benefit, well being, and happiness of gods and men!"
52. Then the Blessed One said: "Do you have faith, Ananda, in the Wisdom of the Tathagata?" And the Venerable Ananda replied: "Indeed, Lord!"
"Then why, Ananda, do you trouble the Tathagata even up to the third time?"
-- Excerpt from Maha-parinibbana Sutta, Digha Nikaya 16
http://www.accesstoinsight.org/canon/digha/dn16.html

The Son :

"If he is endowed with five qualities, O monks, the eldest son of a World-ruling Monarch righteously turns the Wheel of sovereignty that had been turned by his father. And that Wheel of Sovereignty cannot be overturned by any hostile human being. What are the five qualities? The eldest son of a World-ruling Monarch knows what is beneficial, knows the Law, knows the right measure, knows the right time and knows the society (with which he has to deal, parisa).
Similarly, O monks, is Sariputta endowed with five qualities and rightly turns the supreme Wheel of Dhamma, even as I have turned it. And this Wheel cannot be overturned by ascetics, or priests, by deities or Brahma, nor by anyone else in the world. What are those five qualities? Sariputta, O monks, knows what is beneficial, knows the Teaching, knows the right measure, knows the right time and knows the assembly (he is to address)."
-- Excerpt from Anguttara Nikaya, V. 132
http://www.accesstoinsight.org/lib/bps/wheels/wheel090.html

"Bhikkus, rightly speaking, were it said to be said of anyone : 'He has attained mastery and perfection in virtue, attained mastery and perfection in concentration, attained mastery and perfection in wisdom, attained mastery and perfection in deliverance,' it is of Sariputta indeed that rightly speaking this should be said.
"Bhikkus, rightly speaking, were it to be said of anyone: 'He is the son of the Blessed One, born of his breast, born of his mouth, born of the Dhamma, created by the Dhamma, an heir in the Dhamma, not an heir in material things,' it is of Sariputta indeed that rightly speaking this should be said. Bhikkus, the matchless Wheel of the Dhamma set rolling by the Tathagata is kept rolling rightly by Sariputta."
-- Excerpt from the Anupada Sutta, Majjhima Nikaya 111

Interesting how Buddha says "created by the Dhamma" and the Dhamma is the word of the Buddha, and also Jesus is said to be the word made flesh. That's an interesting parallel. It also shows how greatly the Father respected or honored the Son.

John:8:54: Jesus answered, If I honour myself, my honour is nothing: it is my Father that honoureth me; of whom ye say, that he is your God.

"You claim full enlightenment,"
the brahmin Sela said,
"You tell me, O Gotama,
'I am supreme king of the Dhamma,
I make the Wheel of Dhamma revolve,
The wheel that non can stop."

Who is your general, that disciple
Who follows in the Master's own way?
Who is it who helps you to turn
The wheel set in motion by you?

Buddha replied :

"The wheel set in motion by me,"
That same supreme Wheel of Dhamma,
Sariputta the Tathagata's son
Helps me in turning this wheel.
-- Excerpt from the Majjhima Nikaya 92

God :

The Buddha never did claim to be God, but he refered to himself often as the Blessed One. It's interesting to note how on several occasions when Jesus was asked if he is the Son of God he responds, "You say that I am" but when asked if he is the Son of the Blessed, he responds directly "I am." But even more suprising is that there seems to be a definite pattern which may have been conspired by the gospel authors to show that Jesus favors being called "Son of the Blessed" rather than "Son of God." It is the same event told by Matthew and Mark.

Mark:14:61: But he held his peace, and answered nothing. Again the high priest asked him, and said unto him, Art thou the *Christ, the Son of the

Blessed* ?
62: And Jesus said, *I am* : and ye shall see the Son of man sitting on the right hand of power, and coming in the clouds of heaven.

Now this same event is told in Matthew, and it is quite suprising to note how different the response is that Jesus gives even though one may attribute the language of the question being asked simply as a preference of the author, using "Christ, Son of God" as opposed to "Christ, Son of the Blessed." But there definitely is a difference in the answer that each author represents Jesus gives.

Matt:26:63: But Jesus held his peace. And the high priest answered and said unto him, I adjure thee by the living God, that thou tell us whether thou be the *Christ, the Son of God*.
64: Jesus saith unto him, *Thou hast said* : nevertheless I say unto you, Hereafter shall ye see the Son of man sitting on the right hand of power, and coming in the clouds of heaven.

What we see in Matt:26:63 is a direct avoidance of the question *only when it is asked as Son of God* Now this is important. Why? Because it seems unlikely that in recollecting this event that two people would represent Christ as giving two different answers to the supposedly same question. However upon further investigation we find a similar occurence in the gospel of Luke.

Luke:22:70: Then said they all, Art thou then the *Son of God*? And he said unto them, *Ye say* that I am.

The pattern can be discerned. "Son of God" gets an indirect answer, however "Son of the Blessed" gets a direct "I am" answer from Jesus. Futhermore Jesus most often uses the term "Son of man" and not "Son of God." Jesus came 500 years after the passing away of the Buddha and Sariputta. Jesus also explained to the Jews who it was that they called "God"

John:8:54: Jesus answered, If I honour myself, my honour is nothing: it is my Father that honoureth me; of whom *ye say*, that he is *your God*.

I believe Jesus is identifying what the Jews believed of their God as "the Highest," with what he considered his Father to be, greater than all :

John:10:29: My Father, which gave them me, is greater than all; and no man is able to pluck them out of my Father's hand.

"The Highest" was also used by the Buddha in describing his own nature :

Agganna Sutta :
9. 'He whose faith in the Tathagata is steady, established and firm, a faith not to be destroyed by any recluse or brahman, by any heavenly being, or Mara or Brahma, or anyone in the world, can say : "I am a true son of the Master, born from his mouth, born of the Dhamma, created by the Dhamma, heir of the Dhamma."
10. 'How so? Because these are the names tantamount to the Tathagata : "The Dhamma-Body" and, "Of the Highest", and "Of the same nature as Dhamma", and

"Of the same nature as the Highest".

Luke:1:32: He shall be great, and shall be called the Son of the Highest.

So if I were to be asked what is the single most defining attribute of God, I would answer God is the Highest of all beings, and this the Buddha did claim to be, who was enlightened only 500 years before the appearance in this world of the Son of the Highest, or Son of God. Jesus also used the term the Highest when describing the Father :

Luke:6:35: Love ye your enemies, and do good, and lend, hoping for nothing again; and your reward shall be great, and ye shall be *the children of the Highest* : for he is kind unto the unthankful and to the evil.

The Father became unbound when the Son was on the cross :

Mark:15:34: And at the ninth hour Jesus cried with a loud voice, saying, Eloi, Eloi, lama sabachthani? which is, being interpreted, My Father, my Father, why hast thou forsaken me?

The nature of the unbound Father :

"Freed from the classification of form, the Tathagata is deep, boundless, hard to fathom, like the sea. 'Reappears' doesn't apply. 'Does not reappear' doesn't apply. 'Both does & does not reappear' doesn't apply. 'Neither reappears nor does not reappear' doesn't apply."
-- Excerpt from the Majjhima Nikaya 72
http://www.accesstoinsight.org/canon/majjhima/mn072.html

The gift of the Holy Ghost :

Matt:17:20: And Jesus said unto them, Verily I say unto you, If ye have faith as a grain of mustard seed, ye shall say unto this mountain, Remove hence to yonder place; and it shall remove; and nothing shall be impossible unto you.

Mark:11:23: For verily I say unto you, That whosoever shall say and shall not doubt in his heart, but shall believe that those things which he saith shall come to pass; he shall have whatsoever he saith.

Luke:23:46: And when Jesus had cried with a loud voice, he said, Father, into thy hands I commend my spirit: and having said thus, he gave up the ghost.

So according to Jesus, because of his unfailing faith, after he died his spirit was within the unbound Father, which the Buddha described as being deep and boundless, hard to fathom, like the sea-- even so, boundless.

The Holy Ghost is another alias for the Father.

John:7:37: In the last day, that great day of the feast, Jesus stood and cried, saying, If any man thirst, let him come unto me, and drink.
38: He that believeth on me, as the scripture hath said, out of his belly shall flow rivers of living water.
39: (But this spake he of the Spirit, which they that believe on him should

receive: for the Holy Ghost was not yet given; because that Jesus was not yet glorified.)

So do you see how Jesus being "in the hands of the Father" which is like a boundless sea relates to him saying out of his belly shall flow rivers of living water? And by that he meant the Holy Ghost of the Father which was not yet given, because he had not yet been "glorified" in the unbound Father.

What we read in John:7:39 tells us what was gained by the suffering of Jesus, the gift of the Holy Ghost, after Jesus was "glorified" in the *unbound* Father. The Spirit of Christ is the door to the Father's kingdom.

Revelation:3:8: I know thy works: behold, I have set before thee an open door, and no man can shut it: for thou hast a little strength, and hast kept my word, and hast not denied my name.

John:10:9: I am the door: by me if any man enter in, he shall be saved, and shall go in and out, and find pasture.

Luke:12:32: Fear not, little flock; for it is your Father's good pleasure to give you the kingdom.

Ephesians:1:5: Having predestinated us unto the adoption of children by Jesus Christ to himself, according to the good pleasure of his will,

Ephesians:1:9: Having made known unto us the mystery of his will, according to his good pleasure which he hath purposed in himself:

1Corinthians:12:13: For by one Spirit (Christ) are we all baptized into one body and have been all made to drink into one Spirit.

Ephesians:3:14: For this cause I bow my knees unto the Father of our Lord Jesus Christ,

Ephesians:2:18: For through him we both have access by one Spirit unto the Father.

Revelation:3:20: Behold, I stand at the door, and knock: if any man hear my voice, and open the door, I will come in to him, and will sup with him, and he with me.

Luke:12:36: And ye yourselves like unto men that wait for their lord, when he will return from the wedding; that when he cometh and knocketh, they may open unto him immediately.

John:17:22: And the glory which thou gavest me I have given them; that they may be one, even as we are one:

John:18:9: That the saying might be fulfilled, which he spake, Of them which thou gavest me have I lost none.

The Spirit of Christ is one with the Father's boundless parinirvana.

Someone asked me why do they appear to say such different things? For one thing, Jesus purposefully tried to mask the fact that the Buddha was his Father or else no one would have followed him, especially the Jews who had their own ideas about God and the Sabbath and circumcision of which the Buddha did not place any importance, and the Jews being his primary audience. Jesus also said :

Luke:10:22: All things are delivered to me of my Father: and no man knoweth who the Son is, but the Father; and who the Father is, but the Son, and he to whom the Son will reveal him.

2000 years ago it was important that the Father, the Buddha, remain anonymous or no one would have paid Jesus any attention if they only knew he was just a disciple of a mere mortal man.

But they did teach many things in common. There's a book available "Jesus and Buddha : The parallel sayings" which covers many of them.

Also, here's just an example of what I found as a parallel :

"The Dharma and the Vinaya proclaimed by the Tathagata shine forth when they are displayed, and not when they are concealed. But let not this doctrine, so full of truth and so excellent, fall into the hands of those unworthy of it, where it would be despised and contemned, treated shamefully, ridiculed and censured."

Matt:7:6: Give not that which is holy unto the dogs, neither cast ye your pearls before swine, lest they trample them under their feet, and turn again and rend you.

"I now grant you, O bhikkhus, this permission. Confer henceforth in the different countries the ordination upon those who are eager to receive it, when you find them worthy. "Go ye now, O bhikkhus, for the benefit of the many, for the welfare of mankind, out of compassion for the world. Preach the doctrine which is glorious in the beginning, glorious in the middle, and glorious in the end, in the spirit as well as in the letter. There are beings whose eyes are scarcely covered with dust, but if the doctrine is not preached to them they cannot attain salvation. Proclaim to them a life of holiness. They will understand the doctrine and accept it."
-- Excerpt from the Sermon at Benares
http://www.tbsn.org/ebooks/life/benares.htm

Mark:16:15: And he said unto them, Go ye into all the world, and preach the gospel to every creature.

Matt:10:13: And if the house be worthy, let your peace come upon it: but if it be not worthy, let your peace return to you.

Matt:22:8: Then saith he to his servants, The wedding is ready, but they which were bidden were not worthy.

How true Matt:22:8 seems to be in the world today.

Revelation:10:7: But in the days of the voice of the seventh angel, when he shall begin to sound, the mystery of God should be finished, as he hath

declared to his servants the prophets.

The Buddha, who is the Father, is our Lord and Jesus is his Christ :

Revelation:11:15: And the seventh angel sounded; and there were great voices in heaven, saying, The kingdoms of this world are become the kingdoms of our Lord, and of his Christ; and he shall reign for ever and ever.

Revelation:16:17: And the seventh angel poured out his vial into the air; and there came a great voice out of the temple of heaven, from the throne, saying, It is done.

I also discovered some interesting coincidences, and you know what they say, there's a fine line between fate and coincidence.

http://www.mbhs.edu/~bconnell/anagrams.html

It's basically an anagram generator which uses all the letters you provide and it displays various word combinations created out of those letters.

I tried entering the name Siddhartha Gautama but it could not fit, so I tried using the other spelling of his last name Siddhartha Gotama it almost fit, just missing the 'a' at the end.

The Buddha is also known as Shakyamuni so I tried this first and got the following :

AIM SAY HUNK
AM AS YUH KIN

:)

Then I decided to try SIDDHARTHAGOTAM :

A DADA GHOST MIRTH
A ADAM THIRD GHOST
A DHARMA SIGHT DOT
AH ADAM GOD THIRST
A DAD STRAIGHT OHM
A DAD AH RIGHTMOST
A DAD SMART HIGH TO
A DAD ART HIGH MOST
A DAD ART GHOST HIM
A DAD AS MIGHT THOR

:)

I also put in George W Bush :

HE BEG GROW US
BUSH EGO GREW

:)

I tried OSAMA BIN LADEN :

ALIAS NAB DEMON

And ADOLF HITLER :

LETHAL RID OF

The romans have a saying : Nomen est omen. (Name is destiny.)

I believe the name of the Father is Siddhartha Gotama.

Revelation:14:1: And I looked, and, lo, a Lamb stood on the mount Sion, and with him an hundred forty and four thousand, having his Father's name written in their foreheads.

The fact that only so few know the name of the Father of Jesus lends credibility to it being Siddhartha Gotama, because most Buddhists don't believe the Buddha is the Father Jesus refers to, and most Christians don't believe the Buddha is the Spirit Father of Jesus also. I won't bother mentioning Muslims, who recently destroyed ancient Buddhist statues.

Hahahahahaha! No, I just felt that the Atarians I might meet here are pretty
logical people especially since most mayhave dabbled in programming, and if
among you there are those who have some knowledge of both Buddhism and
Christianity, I wanted to get some feedback on what I found in my own
research. It's in the reply thread to Greg Menke. It's specifically meant
for those who've had more than a passing interest in both buddhism and
christianity. I wouldn't expect it to have much meaning to a Muslim or Jew,
it could also appeal to a hindu I guess.

:) Actually Paul the historical Buddha of India 500 BC isn't the fat
laughing buddha that you see depicted by the chinese which is really the God
of luck, you rub his belly and make a wish. The historical Buddha was an
ascetic who lived in caves and wandered around, depending on alms for
sustenance. They typical portrayal of the Buddha who is known as Shakyamuni
has him with a begging bowl in his hands and he has a slender figure, not
pot bellied :)

Please excuse my ignorance for those that consider these stupid questions.
I got the Version 1.0/3.2e PCB yesterday. I can't read the .jpg file of the
schematic very well. Its too blurry for me. The docs don't describe
building it. Is there a parts list for the board components, or does
someone know what parts to use? Do you have to program the Atmel
ATMega161-8PC? Is Digikey the best source for this chip here in US?

6818. ADV: Atari 8-bit CDs/Products by e-mail service from DGS

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-30 20:05:57 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1038686692.43939.0@damia.uk.clara.net>
Source record: 25438

Hello All,

Just a quick reminder that my two Atari 8-bit PC CD-ROMs of Atari commercial software are still available to buy. For full info, and to buy via PayPal with a credit card, please visit http://www.dgs.clara.net

Recently, I launched a new way of buying commercial products from us. 'Products by e-mail' allows you to buy commercial Atari 8-bit products from us at minimal cost. Instead of a physical shipment, the products you choose will be e-mailed to you as a ZIP file containing both ATR and DCM versions of the disk, along with a manual in text format (or PDF if the file is small enough). You can order on-line using your credit card (using PayPal). This now allows you to order products at a much reduced cost, and to have them within 24 hours (usually less).

At present, only a few of our products are available on this service, but more are to be added soon.

Prices start at just US$2.

Please visit the website at http://www.dgs.clara.net and click the 'products by e-mail' button.

Dean Garraghty

You got it Bill. I really do not care about the compression ratio.
The only thing that concerns me is if the image disk works.

>(for several hours in test, at least). Do many/most LED's have enough internal
>resistance built in not to require added resistors? Is there some way to tell
>how much (if any) added resistance is required?
>Thanks,
>Larry

The way to calculate it is as follows:

Each LED has a slight voltage drop (about 0,7 V), so a resistor in series with
it should be able to take the rest of the voltage. At the same time, the current
flowing throutgh the LED shouldn't exceed the maximum for which it's rated.
So R=(V -0,7V)/Imax is the value for your resistor.
If you have several diodes in parallel, this is still valid, since each one is
in a different "branch" with independent currents...
If you have diodes in series, OTOH, it should be R=(V -n*0,7V)/Imax, assuming
you have n identical diodes in series...
If your voltage is lower than 0,7V maybe you shouldn't need a resistor...

It may be there is already a resistor in series. One test is to rig a
volt/ohmmeter to measure current, then insert it between the LED and
supply. If the current is 20ma or less, then you're fine without an
extra resistor. If its more than 25/30, then its a bit much and you
might consider adding small resistors- maybe in increments of 10 or 20
to get the current down.

Contrary to popular belief both 5 1/4" and low density 3.5" are DOD
requirement to be manufactured for many years to come. That's
Deparpartment of Defense or Armed Services, or Military to most. I called
3M Diskette Hotline about the low down on HD disk vs DD disk so that
I wouldn't buy anymore than the one box of HD disks anymore -
1-800-328-9438. I also asked 'where to buy?' and when will it end? I
was told that due to DOD requirement it will probably never end. Each
manufacturer that ever had a contract with DOD is required to supply
those disks forever? I assume this also means 8". But amoung the
'group' of disk makers they have agreed to share the responsibilities of
that requirement. One company will make them for all others and the
ones that don't make them anymore will pay for the first company to make
them for them - you see. They were sharing and rotating the duties of
supplying those disks some 5 years ago when I called - so things might
have changed since then, but Verbatim was then the current maker of
those DOD required disks. Call them and order some new ones. They won't
likely ever offer them in stores or catalogs....
And don't forget your friendly Atari Vendor either - they weren't just
sitting on the fence when those disks began to disappear off the shelves.
They were the ones buying them up by the pallet out of the back room.

As to tricking the 3.5" to do 1.44 meg its more than just messing with the
density selector hole/sensor. There may be higher RPM (300 vs 360), but
for sure there is a higher data rate involved too which also requires a
faster main clock or oscillator to drive the higher data rate requirement
for the 1.44 meg format. In the ST I think it is that you use the density
sensor to shift in a 16 MHz clock where the 720k mode used 8 MHz in order
to get the ST to read and write 1.44 disks. I think you may also have to
use different drives that are even capable of 1.44 meg.

I have a project of sorts (pics to come later) that I require a 3.5" floppy mounted internally on my 8-bit and I was thinking along the lines of an IDE solution.I was wanting to use a SuperDisk drive which is an IDE drive that reads and writes to 1.44 meg 3.5" disks. But it also r/w's to (optical?) 120meg 3.5" superdisks. Will IDE eliminate this need for 16 mhz to run a standard 1.44 3.5" drive? It would be like haveing a 120meg removable harddrive.

Hi Lee-

> As to tricking the 3.5" to do 1.44 meg its more than just messing with the density selector hole/sensor. There may be higher RPM (300 vs 360), but for sure there is a higher data rate involved too which also requires a faster main clock or oscillator to drive the higher data rate requirement for the 1.44 meg format. <

Good to hear that HD 5-1/4" and LD 3.5" disks will be made for future use. I will check with Verbatim, especially since Verbatim is my "disk of choice".

But my idea for the 3.5" HD disk does not involve writing at high density. Since 3.5" HD disks continue to be commonly available (Best Buy, Office Depot, etc.), the issue/idea that I see is being able to reliably use HD disks *in a 720K, LD application* (such as a converted XF 551). Although a converted XF 551 will format a 1.44 HD disk to 720K (by covering the HD sensing hole), the longevity of the data is suspect since both the magnetic coating and compositions are different. So the trick involves only using the higher write current to assure proper magnetizing. The beauty of the 3.5" standard is that the track widths are the same (135 TPI) and the rotational speed is the same (300 RPM) in both LD and HD (and even the 2.88 MB SHD).

OTOH, if Verbatim is going to continue supplying LD 3.5's (and I guess that I should add at reasonable prices and quantity restrictions), maybe there is no need to try this.

Larry

6828. Why is 5200 centipede better than XE?

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-01 18:44:59 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <IHsG9.109051$%j3.38301@news.bellsouth.net>
Source record: 25298

I noticed the centipede movement has smooth horizontal movement but in the computer XE version it moves one whole segment at a time and looks a bit jerky in comparison, sort of like how millipede looks. The 5200 millipede is not smooth like the 5200 centipede though...

6829. Do we need a moderated newsgroup?

Newsgroup: comp.sys.atari.8bit

From: "Dr. Fossil" <erasmus@tempests.and.teapots>
Message-ID: <Pine.GSO.4.50.0212011527310.10775-100000@shell1>
Source record: 25299

On 1 Dec 2002 at 06:39:33 -0800, "Lee" of deja dot com scribbled:
->I called 3M Diskette Hotline ... 1-800-328-9438. ...
->And don't forget your friendly Atari Vendor either -

Uh, well, ... you know, <grin> that's all well and good to say that we should remember the few Atari vendors who are still around, but you're overlooking something.... <sarcasm ON> How are we supposed to know who those few remaining Atari vendors are when they're not supposed to or not allowed to post their notices here!? Don't forget how much bandwidth the vendor-haters use up any time those few remaining Atari vendors post something! <sarcasm still on> (Not to mention how much complaining we have to put up with from certain people in third-world economies who "have to" download these boatloads of bandwidth, paying for every byte and bit of time [and wailing and moaning the whole time], so they can read this newsgroup on their Atari 400 or 600 XE.) <sarcasm OFF>

The time appears to have come for serious examination (again?) of the moderation issue. Do we need a new Atari 8-bit newsgroup that's moderated? Let's face it, folks: It's getting late in the day for the Atari 8-bit platform. This should not be the time for the few remaining Atari 8-bit enthusiasts to have to try to create a new, moderated Usenet newsgroup. I say "try to" because my research into this issue a couple of years ago (for an entirely different subject field) showed that the trend during the last half-dozen years has been leaning more and more against successful creation of new newsgroups in the major heirarchies (such as "comp").

Creating a new moderated Atari 8-bit newsgroup would probably be neither easy nor likely to succeed. However, to sum it up in one word, the situation on this newsgroup has become, well, disgusting. I haven't spoken up until now, but like Richard Nixon's famous "silent majority," I've been watching with diminishing patience. Circumstances have reached the point where dramatic action may be needed, and thus I raise the question about moving to a moderated group.

One side in the pro-vendor vs. anti-vendor war has repeatedly been off-topic and annoyed the majority. That one side has posted irresponsible messages, used abusive language, or posted insults aimed at one of the few remaining vendors, or posted messages pre-tending to be somebody else, and/or doing all this with anonymized addresses. There's only one way to eliminate the "noise" factor on this newsgroup and limit it to on-topic, technical-related talk. (*Including* occasional commercial information or announcements of

Atari 8-bit-related equipment for sale or trade.) That's to move
to moderation.

A moderated newsgroup would be a radical step. The questions we
need to consider are (1) whether it's the best move? and (2) whether
it's practical? Subsidiary issues include: (3) will there be enough
message traffic during the next 5 to 10 years (or more) to justify
all the work that would need to be done to TRY to push a newsgroup
proposal thru the required Usenet red tape? and (4) who, if anybody,
is willing to help chip in to do all that work required by the
Usenet red tape rules? [Also: (5) can this group be changed to
moderated status without going thru all the red tape for creating
a new group? The answer is probably not, but if it's possible I
suggest implementing it ASAP -- as soon as possible.]

If nothing else, let's hope that the "Nimzovitch Rule" (you won't
know what this refers to unless you're a chessplayer) works here:
Namely, that the THREAT of eliminating the troublemakers may be
strong enough to cause them to think twice before they continue
posting their tirades. If they do continue such postings, there
will be no choice but for the majority to take action and move to a
moderated Atari 8-bit newsgroup which (1) will allow ONLY the
responsible postings; and (2) will be tolerant toward those few
remaining Atari vendors.

Answer: very good. All the generic 5 1/4" floppies I bought in
the late '80s and early '90s were completely equal in quality to
the name brands, and their prices were vastly cheaper! Also,
regarding DD, I was a double-density Indus user from Day One of
when I got a floppy drive (almost 19 years ago) and I never had
any problem with either DD or data retention.

That is to say, no problem as long as I abided by the quality
rating provided by the manufacturer. I learned early on not to try
to use the second side of disks rated as "one-sided." Also, as I
pointed out on this newsgroup several times over the years, my
disks were never subjected to tobacco smoke or dank basement
conditions. When I obtained some disks from ex-8-bitters in the
early '90s, I quickly discovered that grime and smoke are killers
for floppy disks, as well as drive heads. As far as I can tell,
all of my own disks maintained in a clean environment are as good
now as they were when new, and the recorded data is still intact.

Don't be silly. No one is anti-vendor. Some people want vendor postings to be less frequent but I don't think anyone has said they should go away. (My issue with BS involves his slamming of auction sellers to further his own business. Basically stabbing one part of the community in the back to make money).

As for the trolls, ignore them and they go away. They want attention. Eventually they'll get bored and find something else to do.

Your suggestion that the threat of eliminating trolls will by itself eliminate them is nonsense. If everyone sticks to the topic at hand and doesn't fall for the trolls' postings, and if the vendors exercise restraint in adverstisements, then all will be good.

On Sat, 30 Nov 2002 at 18:07:08 GMT, "Ron Hamilton" (the "old
atarian"? <Ha!>) scribbled:
->.. and remember that the Indus power supply is *NOT* the same as
->the standard Atari brick!

This reminds me of the story of when a certain vendor at one of
the late and great Atari shows in Indianapolis back in the mid-1990s
INSISTED that the Indus P.S. was the same as the Atari 1050's. This
guy just wouldn't hear of the idea that they were different. He
plugged in a 1050 P.S. to an Indus and the red lights went out.
"Guess that one's blown out," he said. Then he plugged the 1050
P.S. into another Indus and again the red lights quickly went out.
"That one's blown out too," he noted. The guy was good at creating
instant high-tech junk. I moved on to the next booth. <grin>

(Incidentally, does anybody know whether those Induses were
really ruined? Or did he just trigger a fuse inside? I don't know
about Indus power supplies, but I've replaced fuses a few times in
P.S. "bricks" for other Atari items.)

On Thu, 28 Nov 2002 at 20:50:01, "David Pochron" scribbled:
->>Anyone know of a company that still repairs old Indus drives?

Well, there are a couple of dealer types who are known to still
be involved in doing such repairs, but if they post here or others
post on their behalf, "The Other Side" (to use Dean Rusk's notorious
phrase from Vietnam War days) gets mighty upset about it.

Which is why we need a moderated newsgroup! <exclamation mark>
Anyhow, you can contact me by e-mail and I'll be happy to pass along
some info.

I dunno where you found that info but it sounds rather odd. A resistance (usually small, under 300 ohms is typical) is there to limit current. With nearly all LED's if no resistance is in series with the LED the current will tend to get out of hand (like a short circuit realy) and blow the LED. I've heard mention of LED's with "built in" current limiting resistors but those are rare in the extreme.

6836. Cosmic Balance II manual and scans

hi dr. fossil,
i and two other well known atari dealer's fear posting here because of the totalitarians that think they own comp.sys.atari8.
we do not want to have whats happened to ben happen to us.
and you are right, there are lots of readers of any newsgroup that is active that do not partake in the discussions, they are only interested readers.
if they cannot find a place to replace the occasional part or hardware they love they might just move on to something else.
now is not the time to wipe out whats left of the atari dealers in the world.
thanks,
lance

Someone brought a 65 XE to me once that had a similar problem, not yellow
though. I just opened it up and checked out everything, pressing all chips
in the sockets and just tapping lightly on the different parts of the system
board.

When I put it back together after not finding anything I could idently as
obviously wrong, I tried it and it worked. You just never know. Give it a
try.

Hi there,

Does anybody have a schematic and a tutorial on how to upgrade Atari 800XL to have more RAM? I'd like an upgrade that is compatible with 130XE. I don't care about the size of the upgrade, but it should be based on components that are easily obtainable these days.

Any info would be highly appreciated.

Krystian

6845. 810 Drive for Free

You could always check the power supply. I've seen quite a few times if the screen goes red the power supply is bad.

Just a simple suggestion that may help in all these ad posting wars......
What about just adding a signature, like so many have here, to the postings?
That way you wouldn't be posting any huge ads, just a one or two line thing
at the bottom and you would be participating in the group as well. Just my
two cents worth :)

>

Since that is a true IDE controller driven floppy, I would think that
16 MHz wouldn't be even close to what is required. Probably 16 bit wide
and really humming, so the 'toss out the upper half of 16 bit' approach
wouldn't work as is sometimes used for 8 bit IDE systems. But I have no
real idea of how to do it either - I would start with a PC I/0
controller that you know supports that IDE floppy and search for its
data sheets and possibly application notes to glean exactly what the
I/O chip needs as far as data and commands to interface with the IDE
floppy. I know my PC don't do those and that's about all I know on the
IDE floppy.

There's only one little thing wrong with your plan... I'm pretty sure
you've got the requirement for higer write current confused with the
format that it belongs to. Its 720k that needs the higher current. A
better way to put it is - the 720k bias is so high that it tends to
erase more than it records when used on the finer particles of the 1.44
disks. That bias current has been AC since about the 40's, is common to
all magnetic tape recording that I know of and if set too high does
tend to erase the very record that one is trying to make in the first
place. The better way to think of this is that the 1.44 needs the bias
set to a lower level so as to avoid erasing its own data since the data is
going into half the space physically. The particles are actually weaker
for the 1.44 format in that they don't 'set' as strong a feild when
magnetised either, again, in an attempt to cram more data into half
the space. Consequently, the signal read is also weaker on a 1.44 meg
disk, but that can be compensated by higher gain amplifiers to a point.

It was a good plan though!

One very good way to find out who the vendors are is to read the group
FAQ entitled 'Welcome to Comp.sys.Atari.8bit' that is posted on a
regular basis. In there, if anyone is interested, is a vendors list
with email addresses and phone numbers. Not to hard.

The trolls need feeding from time to time, the little ankle biters don't
bother me enough to warrent a moderator.

>"built in" current limiting resistors but those are rare in the extreme.

What I was trying to say with the comment in the last line, was that if the
voltage is too low, well, maybe the LED won't glow if it's in series with a
resistor. But usually, yes, you use a resistor to limit the current and also
take the rest of the voltage, the way I explained.
Let's say V=5V, Imax=20mA (100% hypothetical! check the proper values for
a given case!), you'd have Rmin=(5V -0,7V)/20mA=215ohm, so with a 220ohm
resistor it would be enough. Higher values would provide a lower current
(hence, more safety).

Yep, I'll get in contact with Tom as soon as I can, to get a Holmes directory on his ftp. Still waiting to here back from my webmaster about my files, they may remain online, but wont be accessable from my pages come 31st Dec.

Dont worry, the files WILL be available from somewhere. :-)

Howdy Guy

> The NEW 512k XL upgrade is on the CTH Webpage for Downloading.

I guess the Claus Buchholz and RAMBO are the same thing, hardware wise?
I checked the file, the most interesting stuff seems to what happen to the
pins on the right side of the LS139. One of them is connected to the LS153
on the RAMBO. I hope to find a description of either the RAMBO or the
Buchholz upgrade today. So I can check what's really going on. Maybe then
I can figure out what the ..... your doing with the selftest and why? And
if that might be the cause of the 'poweron/poweroff delay' going byebye.

Yellow screen means your GTIA/ANTIC/Clock circuits and probably ROM/CPU are mostly working. As someone else mentioned, look at power supply and most likely RAM.

My first try at getting one back up is to insure I have a good power supply then leave it on overnight. Quite a few times it will boot the next day. Just a combination of the heat and a thermal cycle is enough to dry them out and get them working again.

> the totalitarians that think they own comp.sys.atari8.

No, I don't think that is it. They are mistaken of course, but it *was* the tradition not to have commercial posts to the newsgroup in the early days. The reason for this was back then time and storage was money and a lot of the internet ran on school systems. Simply put sysadmins would not carry the newsgroup if it had commercial posts in it, something about public money<schools> going to support private business. Everyone was interested in the growth of the internet back then and not having commercial posts in your newsgroup was the way to get carried on more systems. Since then I have had second thoughts on the merits of uncontrolled growth of course.

but...
****
http://www.faqs.org/faqs/atari-8-bit/welcome/
NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.
****

We don't have a charter that prohibits commercial posting and the way the internet works has *legally* changed since that Al Gore legislation thing.

I don't want the newsgroup cluttered up with a bunch of commercial posts and eBay auctions myself.<The 'rare Atari PacMan cart' ones make me groan> Unless there is something special going on, like maybe someone really found a 1450XL and wants to sell it, a once a month post is about right and once a week is just starting to push it. With only ~4 Atari suppliers left in business I don't see a real danger of that happening.

That is pretty much the way it is done in other newsgroups anyway. For instance j131 will occasionally drop by and post a link with a short message about his SIO2PC cables for sale on eBay. The messages are short, infrequent, and you only get the details if you are interested and click on the link. Nobody<?> complains about his messages.

I have had quite a few go out because of bad RAM. Usually they will get as far as initiallizing the display chips<solid color screen, usually green> or will have random garbage appear on screen after they boot i.e. READY prompt will => !EADY =>_EADY ... or odd characters appear where the screen should be blank.

The power supply problems usually have a lousy display as they are going bad, grey bands that look like RFI noise moving vertically down the screen. Next phase of bad is a solid color display followed by not enough juice to even get the screen chips initialized.

??????? First off, as I'm sure you know...the Atari ST was designed around
the Amiga's schematics("borrowed" from Amiga Company before Commodore bought
them. Atari and Commodore were both after the company.) And how can you say
they had no loyalty? Granted, I'm as pissed off as the next guy about their
lack of marketing...and how they screwed up financially...but I can't say
they gave us no loyalty. The 128 was designed as a next step up, while
holding onto the past(with a built in 64), the Amiga was a whole new
concept, and burried the 128 all the way around. That was progress. I'm not
knocking the 128, I've got 2 of them. The Amiga was just ahead of it's time.
The PCs are still trying to catch up in many ways(multitasking being the BIG
one)...They still lack the finesse to do two major things at once, and not
bog the system down.
Especially if you factor in the fact that the Amiga was doing them in
1985....17 years ago!

I'm now jumping down off my soap-box. (LOL)

6866. *PING* Ben & Lance & anyone who has atari stuff for sale/trade (also moderated newsgroups)

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-02 16:02:36 UTC
From: rtdos@yahoo.com
Message-ID: <845192d9.0212020802.2bc9a18c@posting.google.com>
Source record: 25336

http://groups.yahoo.com/groups/atariswapnshop

I created the atari swap n shop to connect buyers with sellers (and to help with rtdos development). Now, I do not have a problem with Lance or Ben posting adverts on the newsgroup. In fact, I encourage it. Along with the regularly posting of the A8 FAQ, it provides a solid foundation (along with the A8 webring and a host of other webrings / websites) for the quickly diminishing Atari 8 bit community. I do have a problem with Ben's remarks about posting ebay links. The only thing I can think of is that he is afraid of the "competition" ebay provides. I think of ebay as just another source of Atari 8 bit related equipment (esp. hard to find stuff). Given the next five years, hardware itself will be increasingly difficult to find if at all, so another source such as ebay is a big plus in my book. Ben's logic to ebay simply doesn't make any sense when you look from other angles or as an example the point of view I just provided.

As far as moderated newsgroups and trolling: No, we do not need a moderated newsgroup. In fact, we already have several moderated forums (such as my swap n shop which admittedly I rarely moderate if at all but encourage posting of anything atari related as well as others such as atari.org atariage, etc). The only trolling I've ever seen lately has to deal with Ben & Bravo Sierra. They stick around because Ben encourages them or leads them on. If only he'd take everyone's advice and ignore them they'd go away. But for some reason he thinks he has to post EVERY "threatening" email to the group. Why? Doesn't make sense. It only seems to encourage the trolls. Oh well. The same thing happened in alt.comp.freeware and everyone agreed that if you ignore them, they usually go away and if you aren't interested in a posting simply ignore it. Of course that last part is kinda hard considering how active this newsgroup has been lately.

The atari community is not dead or dying but thriving elsewhere. A lot of people have probably chosen to stay way from the email list or this group due to the fact of this or that (we know what I am talking about don't we as I won't mention names :o)). Those same people don't seem to realize that they are not only pushing people away from the newsgroup or email list or even the whole community but away from whatever Atari stuff they are developing or selling. Make sense? All this in-fighting is useless and worthless. You are not only hurting the community but driving people away from your ideas or your products or your services.

We need to find ways to encourage people back into the newsgroup or mailing list or to post more frequently Atari 8 related stuff. Moderation is not the answer but self control & personal responsability is. Besides, you want to see rtdos developed don't you? :o)

I know I do, so lets get back to posting Atari 8 related material and let Ben fight his own battles & let Steve and Lance duke it out in court where it should be (esp. after all these years).

6868. Re: 3.5" High Density Disks?

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-02 18:12:47 UTC
From: Bob Woolley <ataribob@directvinternet.com>
Message-ID: <3deba358$1_2@nopics.sjc>
Source record: 25338

From everything I can tell, the HD 3.5 is usable as a DD disk. If you do an XF551 with a 720K 3.5 mechanism, either HD or DD disks work just fine. If you use a 1.44 mechanism, you have to be careful only to use DD diskettes. The reasoning is that the drive itself senses the 1.44 HD diskette and alters the reading and writing electronics for HD operation. If your controller tries to send DD data streams, the process fails on the HD format. A DD diskette sets the drive to 720K and it all works OK. A 720K mechanism does not "see" a HD diskette - so it works OK with either diskette. So, the solution could be to just use 720K drive mechanisms and any old 3.5 diskette. But, just try to find a good 720K drive..... You will probably do better to just block the sensor on a 1.44 drive so that it cannot sense the 1.44 disks. Just be careful if you send the disk to someone who has an unmodified 1.44 drive in an XF551.

Bottom line on the XF551 3.5s, you do not want to go to HD at all - don't even try. Stay in DD.

Yeah - I have a supply of SuperDisks also. One day I'll finish the 16-bit IDE interface and make up a SuperDisk Atari. The SuperDisk also writes to 720K diskettes but I'm pretty sure that we can't use them on an XF551 (dang!). It would be very nice to dump files on the PC and read them on the Atari with a SuperDisk.

The 120 meg disks are just magnetic...

The forward voltage drop on an LED is 1.7 volts, not .7 volts. For 20ma. on 5 volts, you would use 165 ohms (180 ohm resistor). If you are driving a LED with no current limiting resistor, the 5 volt source is probably an IC, which has inherent current limiting to some extent. If you hook the LED to a 5 volt power source directly, it will let all the smoke out of it....

Interestingly, my current Indus *is* a refurbished FutureSystems drive. The history of my drive goes something like this:

1984 - bought original Indus
1985 - drive broke, got out-of-warrenty replacement from Indus
1989?90?91? - replacement broke, got flat-fee replacement from FutureSystems.

The middle drive didn't have the nice twist lock/ejector lever like my first and current drive has - it had a Rana-style tab/level on the front which I didn't like. I like the twist-style levers that you get with the Tandon mechanisms.

Hmm, interestingly the power supply that came with the 1985 replacement Rana-style drive is an oddball power supply with the label "DataByte" on the top. This power supply outputs 11.5V DC at 1.25A. My original power supply was sent back to Indus in 1985 and when I got my current drive from FutureSystems they didn't ask for the power supply, and I didn't get a new one back. I don't remember what the original Indus power supply was rated at.

Although, theoretically the 7805 regulators on the main circuit board should be able to handle 2.5 extra volts without too much of a strain.

In any case, I tried the drive with my variable power supply I use for projects set to 9V and it didn't make a difference as to the drive working.

I removed and reinserted the largest chip (I think it's the UART) and the contacts are totally clean. I can try that on the other socketed chips as well, although they all look good except for the EPROM which does look a bit oxidized.

One thing I noticed is the glue/resin they used to glue the two connectors that connect the spin motor to the drive mechanism circuit board seems to have corroded away the metal. (I see blue-green oxide underneath the glue. Why they glued the connectors together is beyond me.) I'm not sure what I can use to remove the glue and see if the connectors are messed up without damaging the connector.

Ok, I used my good old 24V variable power supply and set it to 11V to match the output of the Indus power supply and that fixed the flickering, but the drive still doesn't spin up.

Here's the sequence of events when I turn the power switch on the drive on:

- Drive briefly displays "AA" in the track LED display which is normal for a drive set to drive 1. (Set it to drive 2 and you get "HH", etc.)

- Drive then immediately displays a Stormtrooper-style "SS":

|_ |_
| |

in the track display. Unfortunately, I've totally forgotten what the error codes are for the Indus drives, and I can't remember where my manual is. (I'm not even sure that's a valid error code.) I know it's not blown segments because the dark segments come on during the drive # identification display previously described.

In any case, that's what I was seeing as the "flicking segments" but now with a reliable power supply I can see that it's this sort-of "SS" image. The power LED and busy light also come on and stay lit.

I forgot to mention that none of the motors come on during any of this. All I get are the above two displays and the drive stops there. Could that be a display indicating it can't spin up the motor?

Hello,
unfortunately Jiri Bernasek / Bewesoft does not have a website nor
e-mail. But his programs are all freeware, except one game (Midnight by
LK Avalon). His programs can be found on the net, take a look at some
polish atari archives to find them or e-mail me for a copy of bewe-dos.
greetings, andreas.

6881. Re: 3.5" High Density Disks?

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-02 19:41:50 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DEBB77E.F8B96A79@students.uni-mainz.de>
Source record: 25351

Well,
I once converted the XF551 into a 3,5" drive. therefore I used a 3,5" HD floppy, a new (patched) OS and some other stuff (to fit the 3,5" into the 5,25" hole; to convert 5,25" power cables into 3,5" power cables, etc.). Now the drive was a HD drive, but the XF floppy controller could only handle DD and refused to accept HD disks. The solution for this case was very simple: I used the 5,25" write protect stickers/stamps (or whatever they are called) and put them on the 3,5" HD-holes. This way the drive could not detect the disk being a HD disk. so everything worked fine. But after a while I gave up using 3,5" disks on the Atari, because none of my friends had them or could use them, besides no software, no programs and no magazines were delivered on 3,5". So my 3,5"XF drive was merely used as an archive - and therefore SIO2PC was a much better choice... greetings, Andreas.

Well,
ABBUC Germany is searching for vendors of 5,25" DD-disks. they produce a
magazine for 400+ members plus run a PD-library. so this club needs
approx. 5000 disks per year. Anyone have an e-mail adress or webpage
where to order those 5,25" DD disks ?!? I called ten firms a few months
ago (including BASF/Emtec, TDK, Philips, JVC, Kodak, Agfa and others),
but they all told me that they no longer produce these diskettes nor
have any left of them... -Andreas.

6883. Re: Spartados Support for Xf551

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-02 20:04:30 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DEBBCCE.E530959A@students.uni-mainz.de>
Source record: 25353

Well,
MyDOS works properly with the XF551. When using a normal/unpatched
disk-version of sparta-DOS with an XF551 you normally receive an
error-mesage like this: "Error - no DOS!" and have to reboot (try it a
second time and then it works). there are several XF551 patches for
sparta dos available, but certain programs don`t like these XF-patches.
I guess the problem only occurs with the disk-based versions of sparta
and not the cart version Sparta DOS X.
-Andreas.

Well,
use this easy trick: put a write protect sticker on the HD-hole of the
3,5" disk. Now the drive will think its a DD-disk and won`t have any
problems with it (so you can still use a 3,5" HD drive with an
XF-floppy)... -Andreas.

6885. Ramdisk infos... (version 2.2)

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-02 20:21:50 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DEBC0DE.B9BA80C2@students.uni-mainz.de>
Source record: 25355

Hello folks,
once again here is my monthly "spam" of the atari ramdisk info text.
this time it is just one big text (instead of three smaller ones). I
corrected many bugs and added some new infos, just to many things to
count or mention them all here. Anyway, have fun reading it or just
ignore it! Anyone may update or correct this article, as well as putting
it on his/her own homepage (since I don`t have a homepage). If there are
no further corrections or updates, this might be the last version I post
here... greetings, Andreas.

--------------------------------snip here

8.10 Atari Ramdisks - An (incomplete) Overview:
[This is version 2.2 from December 2002]

Right from the start of the Atari 8-bit computer era in the late 70`s,
Atari users wanted to have as much RAM as possible (or as their purse
could afford). Having a 16k machine with a tape device was nice and
cheap, but having full 48k or 64k and a floppy drive was much nicer
(and very expensive). Thus many Atari users began to create selfmade
RAM extensions and enhancements, just to save some money. Also a lot of
firms provided extra RAM, RAM enhancements, RAM extensions and Ramdisks.
Besides Atari there were (and still are) quite a lot of producers,
manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or
manuals,
but gives some info about the various Ramdisks on the market. Since
these
notes are written by me, they will merely contain the information I
have.
And as you all can see - it isn`t much information. So any help and
extra
info, as well as corrections, are very welcome. It would be nice to see
this text & info growing. For now let us start here, the info-section
is
divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);

8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above
information should be enough for most programmers to support a RD in
their programs (especially to support more than just one type of RD).
Hopefully future programs will take care about this info or just use
a small setup program to setup any kind of RD. Now let me begin:

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not
reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard
convention
as the majority of ramdisk users don't want bit 4 counted as a control
bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the
'on'
bit for ANTIC's access to the extended memory for 'compatible' (to
130XE)
machines as well. If bit 5 does show up in a bit use table, one can
only
assume that this is an incompatible machine which doesn't have or use
ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Muad`Dib-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 192k-600XL Compyshop 128k
4000-7FFF ??? B ($D301)
Banks: e3,e7,eb,ef,a3,a7,ab,af;
Notes: early CS upgrade version for 600XL only!;
afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-800XL Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;

Notes: afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-130XE Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version with sep. Antic!;
(XE meant 130XE only! this excluded 65XE and 800XE!);
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 576k XL various authors 512k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3,af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43,2f,2b,27,23,0f,0b,07,03
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
It now 100% stable works with all Dos'es and fixes the 10 second
delay when rebooting. (I will publish the fix soon - Guy Ferrante);

2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: used 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 128kbyte Chips x2 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David;
newer MegaRAM version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
K.P./R.D. Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
$D600: F3,F7,FB,FF...
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four switches; the 1MB mode seems to be very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that all XL-type Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one "AND Gate" (refer to ABBUC magazine 63, pages 19+20);
None of the Megaram Ramdisks do have the separate Antic access
built-in, but XE-types can be upgraded easily for this mode!!;

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses
64k as main RAM and 192k as Ramdisk/extra RAM (therefore some
RD-testers will see 240k memory or 15 RD-banks which is untrue!);
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80); Basic: To be able to select the internal Basic, connect a toggle switch between ground and the motherboard where PB1 was removed (PIA `Hole' 11). The switch is not much different than the Option Key, and I found it more versatile. (Wes Newell) => see also ABBUC mag. 29, page 6+7; Atari Basic: yes/no! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or selfmade ones...) most likely do NOT have Antic access, due to the lazyness of its creators or their intentions of simply not needing it. However, original Newell Ramdisks created and sold by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)
Banks: 00,01,02,03,04,05,06,07,08,09,0A,0B,0C,0D,0E,0F

F0,F1,F2,F3,F4,F5,F6,F7,F8,F9,FA,FB,FC,FD,FE,FF
Notes: uses 8 pc. 4Mx1 Chips (541000-80); made by Newell, later by FTE; seems to be very incompatible to existing software and bankswitching cartridges (OSS, Atari, etc.), because normal RAM at 4000-7FFF is NOT available - only extra Ram/Ramdisk banks. With one PIA chip there is simply no bit left to switch between main RAM and extra RAM / Ramdisk. But with the installation of a second PIA chip one would be able to do so. Furthermore one may use (almost) any setup or banks he likes then (with a second PIA chip one could control up to 256 Megabytes of RAM). Basic: To be able to select the internal Basic, connect a toggle switch between ground and the motherboard where PB1 was removed (PIA `Hole' 11). The switch is not much different than the Option Key, and I found it more versatile. (Wes Newell); OS: It is possible to maintain OS bankink using 4 Megs. It requires moving the OS into RAM before any banking of that Bit occurs. Use MOVEOS File on the [Newell-Software-] Disk. (Wes Newell)

Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (most RD-testers will therefore see 240k memory);
Antic access: no!, Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)

Notes: fully compatible to Newell and TOMS (?) Ramdisks;
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

=> Note that (separate) Antic access can be done to all Peterson
and compatible XE-type Ramdisks; just refer to Ed Bachman`s fine
article (supplied with the manual for the Wedge) on how to
update/upgrade your Peterson or compatible Ramdisk for Antic access;
(Afaik only XE-type computers can be upgraded for separate Antic
access, since XL-type computers don`t have the Freddie and Gate
Array chips; the Freddie chip controls the Gate-Array chip; the
Gate-Array chip is responsible for the separate Antic mode...)

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (=newer version);
Notes: compatible to Peterson, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (therefore most RD-testers will see 240k memory);
older versions were designed for 32k banks, but with the appearance of
the 130XE as the new standard, the design had been changed to 16k
banks;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Peterson and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and uses 64k as main RAM and
192k as Ramdisk (therefore most RD-testprograms will see 240k memory);
built in Atari Basic: YES!, XL/XE Selftest: YES! Antic access: no!

C) Parallel-Bus-Devices:
(600XL/800XL = parallel bus, XE = cart-port + ECI and/or adapter)

- Turbo Freezer XL Bernhard Engl 256k
4000-7FFF 2,3,4,5,6 B ($D301)
Banks: E3,E7,EB,EF,93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF;
Notes: The Turbo Freezer XL is an external device for the XL-PBI
with its own Operating-Sytem. It has a built-in Freezer, Monitor
and DOS. The Antic access for the RD can simply be built with one
wire from CPU to PBI. The RD Access works with Port-Bits 2,3 for
Bank Switching, Bits 4,5 for Groups and Bit 6 for "Mode-Select".
PortB D7 = Selftest (0=on)
D6 = Mode (1 = XE, 0 = Groups)
D5 = XE: ANTIC-Access (0 = on), Groups: Group H
D4 = XE: CPU-Access (0 = on), Groups: Group L
D3 = Bank Number H
D2 = Bank Number L
D1 = BASIC ROM (0 = on)
D0 = OS ROM (0 = off)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: optional;

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, more 600XL Ramdisks, Rambo XL (512k by
ICD), some Irata Ramdisks, MIO, as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 12th edition special thanks and credits go to: Lee Barnes,
Russ Gilbert, Mathy van Nisselroy, Erhard Puetz, Mathias Reichl,
Ron Hamilton, Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard
Pahl and Walter Lojek for sharing their info with me. Also thanks to
John Picken for writing an excellent article about ramdisks and
cartridges (especially about bank-switching, which both devices can
do). And thanks to Jindrich Kubec (Jindroush) for presenting this fine
article on his homepage... Finally thanks to Michael Current for
publishing/including this "spam" in his A8FAQ and all the nice Atarians
at comp.sys.atari.8bit for their help and patience. -Thank you Folks !!-
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or other things that might help, let me know. Please do also send
corrections since there will always be some updates and corrections
nescessary. Atarian Greetings - Andreas Magenheimer.

8.11 Ramdisk-supporting Software:
(This is Version 2.2 from December 2002)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has

a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected
program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any
way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs... Now, let me begin:

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) unknown (maybe 128k?);
b) XE-RDs (selfmade drivers!) afaik 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) unknown;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 256 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions);

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) unknown;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 256 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;

(in the Atari scene it is as unpopular as DOS 3 and DOS 4!);

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu!) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/R.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to ??? kbytes;
b) Axlon-RDs (selfmade-driver!) up to ??? kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to ??? kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) Stephen J. Carden;
=> see Sparta DOS 2.x and 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 2.x and 3.x !!
(maybe with RD-drivers for up to 16 Megabytes ?!?)

- Super DOS 2.x Paul Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Paul Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;

- Top-DOS 1.x R.K. Bennett
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to ??? kbytes;

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-RD;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 128k?, 320k 26AE-Ramdisk;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Desktop Atari (TOOL) H.B.S.F
64k, 128k RAM 130XE-RD;
(the Key "7" in the Main Menu copies the whole program into the RD)

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (dec.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.
with TurboDOS up to 256k, with MyDOS or Sparta up to 1 Megabyte,
etc.)

- Diskworker 130XE (Tools) PETSOFT
64k, 128k RAM 130XE-RD;

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loaded from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;
(here the RD-bank Macros *.ADN and/or *.BNK will require extra RAM
/ Ramdisk; simply don`t use them if you merely have 48k or 64k !!)

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)
=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks and credits go to Russ Gilbert, Lee Barnes
and Bernhard Pahl for sharing some info with me. Any further help or
info is welcome !! -Andreas Magenheimer.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.2 from December 2002]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):
e) notes

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);
(1 block with 4 banks, overall: 4 banks);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks;
(2 blocks each with 4 banks, overall: 8 banks);

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;
(3 blocks each with 4 banks, overall: 12 banks);

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;
(4 blocks each with 4 banks, overall: 16 banks);

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) (overall: 32 banks);
(8 blocks x 4 banks -or- 4 blocks x 8 banks);

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) (overall: 64 banks);
(4 blocks x 16 banks for Mathy van Nisselroy`s RD and maybe others);
(8 blocks x 8 banks for Newell, Peterson, TOMS and compatibles);
(16 blocks x 4 banks should also be possible, but do not exist
yet!);

- 2112k-Memory Tester (TOOL) Satantronic`s XRAM 0.18;
2112k memory (64k RAM + 2048k RD) (overall: 128 banks);
(8 blocks x 16 banks -or- 16 blocks x 8 banks);

- 4160k-Memory-Tester (TOOL) ??? (authors unknown);
4160k memory (64k RAM + 4096k RD) (overall: 256 banks);
(16 blocks x 16 banks, means blocks 0-F each with banks 0-F);
(note: with 1 PIA chip the main RAM 4000-7FFF is not available!);

- 8256k-Memory-Tester (TOOL) ??? (authors unknown);
8256k memory (64k RAM + 8192k RD) (overall: 512 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

- 16448k-Memory-Tester (TOOL) ??? (authors unknown);
16448k memory (64k RAM + 16384k RD) (overall: 1024 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

=> Note that 2MB-16MB extra RAM / Ramdisks are very uncommon
in the Atari scene! These upgrades were once sold by ICD and
Newell (maybe a few ones also by FTE) and of course they were
and still are selfmade by some crazy Atarians. It is not clear
if there is any software (games, apps., demos) available, that

supports these mega-upgrades fully. Afaik, only few Atarians
have and use them, mostly users of mailboxes / BBS`es...;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HDD-Partition all Sparta-DOS Ramdisks;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = YES!! ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = YES!!, 8ACE = ??? ;

- Kaiser II (GAME) Phoenix Softcrew / C.Strotmann;
a) 64k RAM Version any 64k XL/XE computer;
b) 128k RAM Version 130XE-Ramdisk;
c) 320k RAM Version 26AE = ???, 8ACE = ???;
(this game comes in 3 separate versions; plays good on 64k
computers, but needs less disk-swaps on bigger machines !!)

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.x (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = YES!! ; 8ACE = YES!! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh
bugs!)

- Memdrv10 (RAM-Tester TOOL) Andr, 'MacFalkner' Bertram
$D301 all Portbits 16k up to 4 MB (all standard RD`s);
$D600 up to ??? MB (Klaus Peters Megaram 3 Ramdisk)
includes 16k Bankswitching and exotic 32k (Buchholz) Bankswitching

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-DOS 130 (TOOL) Kuchera/Excellent
128k RAM 130XE-Ramdisk;

- Multi-DOS 320 (TOOL) Kuchera/Excellent
320k RAM 26AE = ???, 8ACE = ???;
(note that Multi-DOS 130 and 320 are no DOS-Versions, they can
be used as *.CMC players; all the rest is unknown to me...)

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) 26AE = NO!! , 8ACE = YES!!;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- Neo-Tracker (TOOL) EPI/Allegresse
192k RAM (64k RAM + 128k RD) 26AE = YES!! , 8ACE = YES!!;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8,A,C,E Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more + sep. Antic! XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s
Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k
Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k
Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of)
Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- Animkomials meet Boris Valleyo Animkomials+Boris Valleyo;
128k RAM (gr.9+11 pictures!) 130XE-Ramdisk; (has a setup!);

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (authors unknown);
a) 128k RAM ($1E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($36 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($4C frames) RD-blocks 8+A+C+E (TOMS,
etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop or compatible RD can merely see the 192k version!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no?! ; 8ACE = YES!! ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($6D frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($96 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;
b) 128k RAM or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s you can see all demo-parts, however the mainpart,
known as the Edelweiss-Digi-Sample is shorter & sounds strange!)

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Extract-Slideshow Bit Busters / Replay;
128k RAM 130XE-Ramdisk;

- Glasshead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Halle 1994b: Wormhole A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;
(well, this demo does not work at all on 8ACE-Ramdisks!)

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = YES!! ; 8ACE = YES!! ;
c) 320k (Parts 1+2+3) 26AE = NO!! ; 8ACE = YES!! ;
(=> the demo normally runs a setup for 320k memory; but there are
2-3
batch files for each Setup; goto DOS and install the one you want
or
need with the JOB command: JOB @xxxx.BAT [RETURN], then reboot
disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = YES!! ; 8ACE = YES!! ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = YES!! ; 8ACE = yes!? ;
(=> this demo chooses the Ramdisk & Setup automatically! the demo
has quite some graphic bugs on 8ACE ramdisks, but is viewable!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($2E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($54 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($94 frames) RD-blocks 8+A+C+E (TOMS,
etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Megablast-Sounddemo DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the newer/updated version has an auto-setup for 26AE & 8ACE
RD`s!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> a menu appears automatically; setup 15 banks to run the demo!
this demo does not work correct on Ramdisks with refresh-bugs!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni/Stephan Elsner;
320k RAM (TB listings!) 26AE = NO!! ; 8ACE = YES!! ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
192k RAM (RD-blocks A+E) 26AE = YES!! ; 8ACE = YES!! ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = NO!! ; 8ACE = YES!! ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = YES!! ; 8ACE = yes!? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work
here!;
with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk
also)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = NO!! ; 8ACE = YES!! ;
(after loading on an 8ACE-RD be patient! the demo requires some time
for depacking - don`t switch off when you see a black screen, wait!)

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = YES!! ; 8ACE = YES ;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = yes!? ; 8ACE = YES!! ;
(with 8ACE-RD`s you see the complete+bug-free version; with 26AE
RD`s you see a shorter and very buggy version with many deja-vues!)

- X-Demo Mad Team;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

Notes: - 256k Compyshop-Ramdisks, 256k K.Peters-Megaram 1,2,3
and Mathy`s 1024k RD have/use 26AE Ramdisk blocks;
- afaik all other 192k / 256k Ramdisks have ACE (8CE)
or 8ACE blocks (Newell, Peterson, Buchholz, TOMS, etc.);
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- YES!! means the demo works as it should (100% correct);
- yes!? means the demo works but has some bugs or is shorter
(50-80% correct);
- no?! means the demo almost does not work and has many bugs
(10-40% correct);
- NO!! means the demo does not work at all - it refuses to load
or crashes shortly after loading (0% correct);
- sep. Antic means separate Antic access of the Ramdisk;
(only 2 programs seem to exist: Video Blitz & The Wedge);

Thanks and credits go to Russ Gilbert and Bernhard Pahl for sharing
their info with me. Any corrections and/or updates are welcome...
- Andreas Magenheimer

6888. Ram Test

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-02 23:39:00 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <3DEBEF14.3AB286A1@asw.cz>
Source record: 25358

Hi,

130xe is going directly to ram test after powerup:

ROM
GGGGGGGGGGGGGGG GGGGGGGGGGGGGGG

RAM
G R G R G R G R G R G R G R G R
R R R R G G R R R R R R R R R R
G R G R G R G R G R G R G R G R

Which chips to throw away? There's 2 x 8 chips. Most of them 4264-15,
except for first, which is Nec 4164C-15. The computer seems untouched
(i.e. not physically broken). None of ram chips is hot.

Computer is old ('85), so that it doesn't contain new 130XE ramtest in
bios.

> which has inherent current limiting to some extent. If you hook the LED to a
> 5 volt power source directly, it will let all the smoke out of it....

BTW: If you are driving an LED with an TTL IC (like 74LSxx), don't
forget that the high output voltage is only approx. 2.4 V, not 5V!
So, in general, it is better to use an inverter instead of a
standard buffer, and connect the cathode ("minus connector") of
the LED to the IC output, and the anode of the LED to +5V.

The standard "low" voltage level for TTL ICs is approx. 0.4 V,
so you get a voltage difference of approx. 4.6V instead of
only 2.6V.

so long,

Hias

->... the power supply that came with the 1985 replacement Rana-style
->drive is an oddball power supply with the label "DataByte" on the
->top. This power supply outputs 11.5V DC at 1.25A.

The DataByte label wasn't oddball at all. For years the Induses
came with those. On the contrary, a 9V DC brick would've been an
oddball. All the Indus power supplies I ever saw were 11.5V DC, and
I can say that I accumulated a large number of them over the years.

On Sun, 1 Dec 2002 at 17:23:04 -0500, Paul Gifford scribbled:
->As for the trolls, ignore them and they go away. They want
->attention. Eventually they'll get bored and find something else
->to do.

My dear sir! (Which is my ever-so-gentle way of providing a teensy-weensy bit of advance notice that I'm going to oh-so-gently say something serious. Okay.... Are we ready?!)

To be pithy yet blunt, I will say plainly and clearly that I profoundly disagree. Several decades of experience in dealing with troublemakers in various social circles cause me to label your above words as mere wishful thinking. It's hopelessly naive to think that trolls, troublemakers, and assorted sociopaths will voluntarily disappear just because they will (supposedly) become "bored." It's also naive to think that trying to ignore them will work as a method to discourage them. That just plays into the troublemakers' hands. They like it if the mainstream of society ignores them, because that means they can continue their trans-gressions without interference.

There's only one way that society can ever successfully deal with such troublemakers. Responsible people must be willing to take a stand against social disruption and the disrupters who cause the problems. Responsible leadership must be adamant in leading the way, cracking down where necessary, and maintaining a just and lawful order. As we've seen, there's as much need for this in the online world as there is in the offline world!

There's more that can be said on this subject, but I want to save some comments for other replies that I'll shortly be posting in this thread. Meanwhile, suffice it to say that the threat of going to a moderated newsgroup must now stand as a warning to the troublemakers.

->Your suggestion that the threat of eliminating trolls will by
->itself eliminate them is nonsense.

<ha-ha!> Well, obviously you're not a chessplayer, and I suggest you don't try to take up the game. In the early 20th Century the professor and grossmeister of chess, Aaron Nimzovitch, said that the threat is often more powerful than the execution. (I think you'll find that people of the stripe of Henry Kissinger and Colin Powell are familiar with Nimzovitch! They apply the same doctrine, except their threats are nuclear-tipped! <grin>) In fact, I believe that Nimzovitch's adage was too mild. The threat must always be stronger

than the execution -- or else it would be a bluff. In this case, here today, the troublemakers need to understand that once the majority are aroused to action, action will follow, and then the troublemakers will be dealt with. Either the troublemakers *must* stop disrupting this newsgroup, or else the formal process of proposing a moderated newsgroup *will* begin.

->If everyone sticks to the topic at hand and doesn't fall for the
->trolls' postings, and if the vendors exercise restraint in
->adverstisements, then all will be good.

Dream on. But for your sake (and indeed, everybody's sake), I hope your dreams pan out.

Final note: This posting contains the tuff stuff. Let's hope that the troublemakers (or trolls if you want to call them that) heed these warnings. If so, then we can all ease up, and then hopefully the newsgroup will be able to return to being a mainly technical-oriented discussion.

On Sun, 1 Dec 2002 at 23:35:03 -0600, "Ilmarinen" scribbled:
->Just a simple suggestion that may help in all these ad posting
->wars..... What about just adding a signature, like so many have
->here, to the postings? That way you wouldn't be posting any huge
->ads, just a one or two line thing at the bottom and you would be
->participating in the group as well.

This posting is a bit puzzling. The people selling stuff already sign their postings, and/or everybody well knows who they are. And since this post was a reply to my posting, I might note that I sign all of my writings. (See the "taglines" or "footers," not the headers, for real info.)

So who's left? Answer: the trolls and troublemakers. And they're not about to sign their anonymized postings, thereby letting the whole world see who they really are. But if there are any trolls out there so dumb that they can be "persuaded" to sign their postings, then by all means let's ask them to sign their postings! <grin> And while they're at it, they should use their real e-mail addresses! <grin> Yeah! How about it, trolls? Are you brave enough to do it?! <ha-ha>

From: llppwhite@aol.comnsp
Message-ID: <20021202213822.07504.00004990@mb-ml.aol.com>
Source record: 25363

Thanks very much to all that replied. It looks like no one has tried what I am suggesting. For those that have suggested using a 1.44 disk by covering up the high density sensing hole -- yes, most any 3.5" drive will successfully format it, but *will your data be there in 5 or 10 years?* Maybe and maybe not. The oxide formulations and thickness of double density and high-density 3.5" disks are different, and being able to properly accomodate that difference is the crux of my idea.
Larry

On 2 Dec 2002 at 07:11:23 -0800, "rtdos" from yahoo scribbled:
->nothing wrong with ebay posts.

Okay. But responsible people shouldn't be forced to go to E-bay
or Yahoo or some other place just because the trolls rule the roost
here. That's not an acceptable scenario.

-> [A]nd if you ignore the trolls they WILL go away.

Disagree.

-> [T]hey thrive on attention. BS seems to be the only [one] left
->feeding them.

There's been a common idea running thru, or implied by, a number
of recent postings that Ben is a bad guy because he's been attacked.
Now, I have to hasten to point out that I've never bought anything
from him, nor have I ever had any substantial contact with him.
(It's possible I might have asked him some question by e-mail seven
or eight years ago, but for all practical purposes I've never had
any contact.) So I'm not defending him because of being a customer
or a close friend.

But now, let's consider the matter: Some people have posted
that they would NOT buy anything from Ben simply BECAUSE other
posters have attacked him. In other words, if he's been tarred
by trolls, ergo he must be the bad guy. In a word, this is crazy
logic. Let's remember that it's the trolls who are the bad guys.
It's the trolls who have posted anonymously with irresponsible
language and in irresponsible ways. Any infractions by Ben or
any opinions of his that people may not agree with (such as his
views about auctions), pale in comparison to the actions by the
troublemakers on the other side.

Point made. 'nuff said. "Finis." (Latin for "The End.")

There hasn't been any porn in any newsgroups I've looked at for
nigh on half a dozen years now. Apparently my ISP runs better
filters than yours does. It sounds like you should consider either
changing ISPs, or asking your ISP to run more effective filtering
programs.

Simply learning to use filters/rules/killfiles or whatever your
end might label them can also make a world of difference.
I have several filters set, and thus several so called trouble
makers cease to exist at my end. Just more ideas. ;-)

So what? If you're a deity seeking incorporation in this world,
you're pretty much stuck with flesh no matter what your doctrine is.

> told by Matthew and Mark.

Blessed One is an English translation of the original wording. I
suggest that you should compare that to the original
greek/hebrew/whatever the original Christian documentation was written
with in order to evaluate the relationship. I have a couple
translations of various parts of the Lotus Sutra, and between the two

of them, Shakyamuni ends up with approximately a gazillion different
names, and thats before they start naming all the other subordinate
Buddhas. Its almost enough to make one start assigning acronyms.

> Mark:14:61: But he held his peace, and answered nothing. Again the high

> also explained to the Jews who it was that they called "God"

I don't see a pattern. I see different answers to different people in
different circumstances. Perhaps the editors of the various documents
that form the Bible could suggest some better reasons.

> So do you see how Jesus being "in the hands of the Father" which is like a
> boundless sea relates to him saying out of his belly shall flow rivers of
> living water? And by that he meant the Holy Ghost of the Father which was
> not yet given, because he had not yet been "glorified" in the unbound
> Father.

No I do not. Finding passages that refer to sons and passages that
refer to fathers in the two documents, then on the basis of which
mentions the other, to infer that Buddha is Jesus's father- and in
fact, God, is in my opinion, presumptive.

> The Spirit of Christ is one with the Father's boundless parinirvana.
>
> Someone asked me why do they appear to say such different things? For one

> was just a disciple of a mere mortal man.

How do you know this?

> But they did teach many things in common. There's a book available "Jesus
> and Buddha : The parallel sayings" which covers many of them.
>
> Also, here's just an example of what I found as a parallel :

These kinds of books are interesting. I happened upon one that put
Buddhist doctrine in Christian language and vice versa, I should have
bought it...

> I also discovered some interesting coincidences, and you know what they say,
> there's a fine line between fate and coincidence.

Coincidences are everywhere, but they don't always mean something.

> I believe the name of the Father is Siddhartha Gotama.

Whatever floats your boat. Just keep your garden plowed.

> The fact that only so few know the name of the Father of Jesus lends
> credibility to it being Siddhartha Gotama, because most Buddhists don't
> believe the Buddha is the Father Jesus refers to, and most Christians don't
> believe the Buddha is the Spirit Father of Jesus also. I won't bother

Just because something isn't widely known (for some value of known),
doesn't make it any more or less true than some other more widely
circulated assertion.

I don't think superficially relating figurative senses of "father"
will achieve much. For one thing, your base documents are the modern,
accepted versions of documents that have been retranslated, edited,
revised and tweaked for thousands of years. For you to understand
what Jesus meant by Father with enough precision to relate it to what
the Buddha meant will require far more exhaustive research. You
yourself suggested that the editors and translators of Christian
doctrine might be imposing their opinions (sometimes unavoidably,
other times not), and I imagine similar things could well be the case
in Buddhist text.

I see a lot of parallels between your reasoning and that illustrated
in its extremity in Foucalt's Pendulum by Umberto Eco. Its a great

book IMHO.

Hmmm... didn't the article contain one? (checks old Atari files on the shelf)
Hmmm... I see, it's just a connections list. But it shouldn't be too difficult
to develop a schematic from that connections list, actually.

Oops, I meant 'connections list'. Most memory upgrades come without schematic (mine does).

Andreas told me he has it in electronic form. If not, I'll ask again. 'connections list' will be fine. I just want to know what Guy Ferrante's upgrade does that causes the computer to be able to instantly reboot. Eliminating the 10 second pause otherwise needed to drain the RAMs.

Different strokes for different folks. I've received comments that ranged from "It makes perfect sense." and "rarely have I been fascinated -- Ben Stein, who is a Jew and likes the Buddha" to comments similar to yours. I can only guess there are real factors in our lives which predispose us to think one way over another. One of the most surprising things I ever heard Jesus say was this :

John:6:44: No man can come to me, except the Father which hath sent me draw him: and I will raise him up at the last day.

Hello folks,
a while ago a schematic for a polish CD-Rom interface appeared in ABBUC magazine. This works like a turbo-tape, meaning you can only load programs into your atari (speed = turbo-tape speed). My friend Raimund Altmayer now owns such an interface, but he doesn`t have any software or drivers for it. Is there anyone who owns this software or drivers, e.g. Fox-1 or TXG ?!? If so, can you send me a copy of this software ???
greetings, Andreas.

Hi,

I think on the web you can find some loaders on czech web-sites...

When I have time I will look...

Also on the german e-bay you can buy these carts. Last month I bought 2
carts which contains utility's and loader.

I think here is part of the problem. I have *never* seen Ben post anything in this group besides the weekly advertisement. Others, such as Lance, do add to the discussions.

This would all be a moot point if Ben would limit his advertisements to once a month *AND* join us in the discussions that go on here. By adding to the discussions he could advertise practically everyday and not a single person would compain.

All,

Okay, so what would you expect to happen during Thanksgiving vacation? Disk corruption? Yup!

Anyway, the JYBOLAC BBS at (telnet://jybolac.homelinux.com:800) has been down
for the past couple of days thanks to a disk image going bad. Thankfully, I did a backup right before the holidays, so not much was lost. The last message I could recover was from 11/26....not too bad.

Well, come on and telnet to the world's only XEGS connected to the internet! :)

telnet://jybolac.homelinux.com:800

Sorry for the inconvience.

Taking my own advice, I called the 3M hotline number only to
find that in the past 5 years or so since I last called,
Imation is now the company at that number and they don't
know anything other than their own line. They don't have
any as of 2 years ago. I did find some 720k 3.5" disks at
Verbatim, and 5 1/4" HD disks at http://www.pricewatch.com
but no 5 1/4" DD anywhere. Which only leaves the Atari
vendors and maybe a rare find on ebay?

Stephanie at Imation didn't know anything about a DOD
requirement either - perhaps that was just so much BS from a
bored phone support tech? He sent me a catalog that did
have at that time a dozen disk makers' lines of floppies and
there were several to choose from in the 5 1/4" DD catagory.
But that was then and the catalog is long gone too.
There are a lot of surplus houses - if I find a wad of disks
in one of them, I'll drop you a line via email.

6919. Axlon memory upgrade question

Newsgroup: comp.sys.atari.8bit

Howdy folks

A friend of mine wants to know the following:

If RESET is pressed on a computer with an AXLON memory upgrade (real AXLON, not AXLON compatible), is the home bank switched back in? (home bank is the bank that's switched in when the computer is powered up)

In other words, is the RESET line used on real Axlon memory upgrades? Axlon compatible upgrades don't seem to use it.

Howdy Mo, folks

> to never include quoted text in a reply

I like to leave enough quoted text so that the reader is reminded of what I'm answering/commenting to. It's not only easier on the brain, it also prevents people from getting angry at you because they think your answering/commenting to something different.

But I do cut off most of the unneeded stuff. Heck, internet could be easily twice, three or maybe even four times as fast if people didn't quote EVERYTHING, EVERYTIME. (getting off my soapbox now.....ouch....man this is high....)

How exactly would you check? I have the Axlon 128 in my favorite 800
utilized for a MyDos ramdisk; I got it used with a single boot disk of 2.0S
modified and no programming docs.

I read in the recent upgrades posting that the $CFFF control port is read
only. Seems like one would need to poke banks and then some unique data into
selected RAM before doing a Reset and peeking to see which bank was active.
Would that be reasonable?

Go here and read about drives and disks and stuff...

http://www.island.net/~jfleet/ch13.htm#Heading28

The formulation of DD and HD diskettes is the same, but there are minor
differences in thickness and coercivity....

Look at the differences between DD and HD on a 5 1/4 - that is why they
can't be swapped.

Your data will still be there in 10 years

Bob

Hi Larry,

back on 7.20.02 you asked this question. I saved it until my next visit to my
parents' place, which was last weekend.

We have OSS disk issues Fall 86 and Winter 87 only. That would support your
theory that these may have been the only disk issues published.

I don't remember ever seeing paper issues.

I have it too, it was inside some .ATR file IIRC which collects all the
various memory upgrades... there was even one for the 800. From what I
remember, they were two files (maybe they were .ARC instead?). Let
me see... I think they were called MEMUPDATE or something like that.
Ah, found them: ADDMEMA.ARC and ADDMEMB.ARC
You could find them at the UMich archives...

> ??????? First off, as I'm sure you know...the Atari ST was designed around
> the Amiga's schematics("borrowed" from Amiga Company before Commodore bought
> them.

Nonsense. The two machines are just too different for that to be the
case. The ST consists of relatively simple custom gate arrays for video
DMA and system glue, and does almost everything else with a bunch of
off-the-shelf chips. The Amiga is built around several large complex
ASICs and few off-the-shelf chips. The different design philosophies
were why the ST was a lot cheaper, but also not as capable in some
aspects (graphics, sound). They also mean that Atari would not have
benefitted from sneaking a peek at Amiga schematics, because the Amiga
used very different components.

Besides which, the board design was no big deal. The difficult
engineering was all in the custom chip designs, and it's pretty clear
that Atari's custom logic for the ST was not related to the Amiga's in
any way.

That would be one option. But maybe you can follow traces and see it the RESET line is being used by the board. I guess these boards have documented connectors? If the RESET pin goes somewhere on that board, it's probably used for resetting the memory on it. (I guess.)

Howdy folks

> > When OSS sold out to ICD, I had just re-subscribed, and ICD never published
> > any more issues (story of my Atari life).

Kinda reminds me of my subscription to Atari Classics. I renewed, but missed one issue because I hadn't expected it so soon. So I contacted Bob Woolley and he sent me the issue before the last one. I had already received the last issue before I noticed that I missed one. I paid for 6 issues and 3 disks while I only got 2 issues and maybe 1 disk (not sure, but I'm under the impression I didn't get that one either.) That was a couple of years ago. Bob Woolley will answer to a lot of questions, but never to questions about Atari Classics, or my money.

although the 5200 OS is similiar than the 400/800 OS (actually closer
to the XL I do believe) it has some video capabilities lacking in our
400/800's. may want to check out atarimagazines.com or ask Savetz if
he remembers which magazine might've carried an article describing the
differences between the 5200 & the 400/800. I know there was an
article and I'm thinking it was Antic, not sure.

6939. atari trak-ball (wico) HELP!!!

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-05 15:24:44 UTC
From: JP <myemail@home.com>
Message-ID: <0dKH9.247866$P31.96617@rwcrnsc53>
Source record: 25260

Hello. I just purchased a wico trak-ball on ebay, and it doesn't seem to work right. But I wanted to verify it here as I have no experience with one.

As I understand it "Missile Command" should work with one. I tried it with this and centipede and the only thing that worked was the fire button. I couldn't get the player to move l/r u/d at all.

I ended up opening up the trak-ball to see if there was something visibly wrong with it and all I see is 2 plastic circular wheels that spin inside what looks like laser eyes. This seems very hard to test as there is no physical contact between the wheels and the eyes.

Does anyone have any input or testing procedures they could post?

All help appreciated.
J

ok, here is something i'd like to attempt: anyone have 2 tapes that they can send me, one with ML program (duplicated on both sides) and the other with BASIC program (duplicated on both sides). Both should write some sort of data back to tape if I choose to. I'd like to see if I can get 1050-2-PC or my ProSystem Cables to work with rtdos somehow.

On my MyIDE computer with the software-MyIDE patch I switched to Bewedos.
Because Spartados won't work with myide+software OS

Bewedos 1.3 is a very nice dos.

+ in bewedos:
it runs on atari 800
almost everything that runs with dos 2.5 runs with bewedos
its freeware

- in bewedos
no build-in high-speed SIO
no direct read from other disk formats (you need a special utility to read
dos 2.5 format)
no build in copy command (you need an external command)
- Bobterm won't run on bewedos 1.3

More than reasonable, it'll about be the only way to tell
for sure. I only have the 'compatible' Axlon upgrade and
these are custom made eight(?) bank units. I'm not sure
who made them or what to call them other than 'custom'.
But on my units, the CFFF 'latch' is write only where it
will accept bank bytes but one does not know which bank is
active by just reading the CFFF location. You only get
garbage at CFFF when a read is done, yet the active bank
remains active. On powerup or RESET the OS 'sets' D301
(port b, 130XE type ramdisks) to FF - that's also an
internal function of the PIA chip whenever the RESET line
is triggered. But the 'custom' latch at CFFF is not reset
to zero _ever_ in the OS which leads to troubles with a
pre-formatted ramdisk in that if the RESET event takes
place when the active 'custom' bank is non-zero then that
bank gets overwritten with the running code of DUP.SYS
which then makes that particular bank corrupt. This is
assuming that for what ever reason the powerup clear ram
routines are run and a DOS boot takes place from a real
floppy and that DUP.SYS is not stored as a file in the
ramdisk. I'm also assuming that the Axlon power up
'home' bank is zero like my 'custom' units are. Banking
bytes are then 01, 02, 03, on up to the maximum size of
the memory upgrade where my banks then begin repeating -
00=08, 01=09 02=0A, etc.

One could peek at 16384 (4000h) then poke 53247 (CFFFh) with one and then peek 16384 again to verify that the value there was different. If not different then make it different with a poke of a random number. Then press RESET and peek at 16384 to see if it compares to the very first peeked value. If it is the same value then the Axlon does home bank correctly on its own.

I can only assume that ramdisks were a new concept when my custom units were designed and the designer simply overlooked this problem due to lack of experiance. There _is_ a latch that has a 'clear reset' function built in and that could have easily been included in the original design if only they had thought too.

In the MyDOS project, I've included a store zero to CFFF in the DOSINI routines, but by then its too late to save much if the clear ram routines have already run. Still, it might save a few 'custom' ramdisks - I was just wondering if the Axlon ones were OK to start with and I didn't have to worry about them at all. Any report from real Axlon owners on any of the subjects above being different than the 'custom' Axlon that I have described would be appreciated - its hell writing software for hardware you don't have. Thanks.

6947. RadioShack..what gives?

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-05 18:47:03 UTC
From: Bralgar <brentgarveyHEAD_FROM_ASS@skyenet.net>
Message-ID: <ycNH9.12246$5P3.898264@newsfeed.slurp.net>
Source record: 25268

I went to RadioShack today to pick up a few parts for some mods I'm doing to my 7800 (svideo)and my 2600 supercharger. I get in the store and their component section has dwindled to almost nothing. A salesman approched me and asked if I needed any assistance and I said, "Yes, where are all your IC's?" He showed me a drawer (everything is condensed to a drawer system) with about 10 different parts in it (timers and such) and said that this is all they have left they are discontinuing them as stock. I was crushed. He did say, though, that they can be ordered or ordered on RS's website. I liked the convienence of a local electronics parts place. What to do? What other places chains in the States stock electronic parts? I can't think of any. If I have to start ordering online I sure won't be doing it from RS's site. I only paid their prices for the convienence of getting it same day.

I was able to get the transistor I was after and some caps but the selection is dismal to say the least. I couldn't even find DIN connectors(cable or pcb mount). Maybe I can find an independant RS franchise owner that has the inclination to continue stocking the good stuff.

Digikey, Jameco, BG Micro, Mouser for mail order. Some NTE dealers
have showrooms and can order stuff- I've had pretty good luck that
way, though naturally the store is on the other side of town...

I always liked Radio Shack because I could go in and put my paws on
their stock- its too bad they're slowly getting rid of the parts. I
also find it amazing they <still> ask for customer phone numbers-
though they're less insistent on it nowadays.

This sounds closer to the truth, because the 5200 centipede is so arcade like it put's the 400/800 version to shame. I was hoping that 5200 millipede would have been just as smooth, but it's pretty much identical to the 400/800 versions.

Sorry, Lee;
I *meant* to say that $CFFF was write only and meaningless garbage when
read...

I will have to do some playing with it and report back... I *do* know that
the Axlon 800 has a cold start switch and the Ramdisk contents are undamaged
after a reboot from disk.

BTW, I thought most Dup.Sys's never exceeded $3600 or tops $38FF which
should allow 48K machines to avoid infringing that $4000-$7FFF block with
both the screen Ram and Dos usage.

I don't think there are any differences in the way the 5200 handles
ANTIC. The 5200 does have the GTIA and not the CTIA.

I think you are speaking of A.N.A.L.O.G. magazine number 15. You can
read the article on Dan Boris' site at
www.atarihq.com/danb/files/52analog.txt

> I noticed the centipede movement has smooth horizontal movement but in the
> computer XE version it moves one whole segment at a time and looks a bit
> jerky in comparison, sort of like how millipede looks.

It may not be the same game. They may have updated it for the 5200
like they did for others. A disassembly of the game will show that :)

Tried Control-T and the screen flashes, but still doesn't move the target..
Does your target move regardless of the mode? How can you be sure that you
are in 'trakball' mode?

thanks for the help!!

I too have been looking for a supplier of 5.25" DSDD disks. Here
below is a cut and past of a online company who sells them.

Thank you for your inquiry. The pricing for the 5.25" unformatted
discs (10 per box) is
as follows:

Qty. 1-2/bx 3-4/bx 5 +
$5.95/bx $4.95/bx $4.50/bx
plus shipping. We accept major credit
cards visa, MasterCard and American express.

Regards,
Athana Sales Dept.

With the Atari 8bit you have a choice of two command line style DOSes. SpartaDOS makes use of the
"RAM under the ROM" that only later Atari models have, while BeWe works on the Atari 800 too. I have
an Atari 800 so BeWe was obviously the choice for me, but I think it is also a good option for people
who can run Sparta, because BeWeDOS is "lean and mean."

It is true what Marius says that BeWe requires a special utility to read disks formatted in some
other DOS versions, but this utility comes with BeWe and it is really not hard to learn at all. It
sort of makes you want to reorganize and switch all your disks over to BeWe format.

They are both good choices.

Ripoff shacks been dumping their electronics components hear years ago. Earlier this year the stores in canada went as far as to dump their amateur / cb / scanner radio section. Theyre pretty much a stereo store now, with a few remote control toys (cheap ones at that) for christmas.

Source record: 25283

Yes, but as far as i tried isn't there a format program to do that with bewedos.

So I did it with a trick. Just make an .ATR image with ape (same size/density) as your HD partition and format it with spartados. Then copy XBW130.DOS on it. Look carefully which sector is the highest used for this (use APE for this) and then make this XBW130.DOS the bootable dos on this atr.

Now Boot the MyIDE patch (without any partitions on D1: on your hd) and MyIDE patch will boot XBW130.DOS of D1: from your brandnew created .ATR image.

Now use a sector copy program to copy the used sectors of this .ATR to an empty HD partition. I use SECOPY16.COM for this. If you don't have it, mail me...

After this, change your MyIDE Dx you have created to D1: and you are ready.

Yes, the tool to read the DOS2x format is not hard to use. In fact is really easy, and it looks fantastic.

But... i would like to have a command-line program to do the same. Like the COPY32.COM that came with dos 3.0

Or better a patch ... to make it possible to read those disks with bewedos itself

But you are right. BEWEDOS is really cool, and since it runs with MyIDE I'm glad I have it.

There is no way of telling which mode you are in, the screen flashes as you say
when you enter trakball mode. Even if you are in the wrong mode the crosshairs
should wobble when you move the trakball.

Howdy JP, folks

> I ended up opening up the trak-ball to see if there was something visibly
> wrong with it and all I see is 2 plastic circular wheels that spin inside
> what looks like laser eyes. This seems very hard to test as there is no
> physical contact between the wheels and the eyes.

I've never owned a Wico trakball and it's been a while since I opened my Atari TrakBall, but maybe I can help.

TrackBalls are like mice. One of my ST mice (I have 2 ST mice, but never wanted an ST, so I don't have one) didn't wanna work correctly when I bought it. So I opened it up. Try the following:

- Write a small routine in BASIC that will show you the values for pins 1-4 on the joystick. (If you don't wanna write one yourself ask me and I'll look for the utility I used. It might be in TurboBASIC though)
- Open the trackball and carefully remove the shaft that moves between what you call the laser eyes. (it a combination of an infrared LED and an infrared sensor.)
- Take a small piece of paper. Preferably black or silver (we don't want any light to go through)
- hold the piece of paper between the 'laser eyes' and see if the values you utility shows you change. If the values don't change, there is something wrong. If atleast one of them changes you know the power (or negative, I'm not sure which one is used in Trackballs) is OK.
- If you have a multimeter, you can also measure the voltage over the LED's and sensors. If these are OK (constant voltage over the LED's and changing voltage over the sensors as you move your piece of paper in and out the 'laser beam'.) the problem is in the wiring. If not, the problem is in either the LED's (or the circuit delivering power to it) or the sensors.

Hope that helps.

BTW make sure that ball can't move. I have a Trakball-ball with the imprint of a screw in it. (there aren't that many screws in a trackball housing, but Murphy's law says the ball will drop right on one of them) And crawling under your desk to chase after a Track-Ball's ball or Mouse ball isn't my kinda hobby.

Hi Bob-
ataribob@directvinternet.com said:
> Go here and read about drives and disks and stuff... <

Yes, I have owned most of the volumes since V2 or so. But we will have to agree to disagree on this issue.

If one reads all the text, the author goes into the differences in detail. And logically, if the coercivity is greater and the thickness is less, how could the formulations be the same? He is saying (I think) that the general classification of formulation is the same. (Cobalt-doped Iron Oxide)

I'd admit that the LD and HD disks are *very* close -- much, much, much closer than 5-1/4" disks. And some brands/time periods of manufacture were closer than others. (I purchased Sony SS/DD diskettes in the early '80's that could be 100% formatted in HD. And they were stable on the PC for years. I had at best 50% success in even formatting other major brands.) I'd also believe that operating in a lower bit density offers an extra safety margin in using HD disks in the DD application.

I have contacted diskette mfg's. in the past, and they do not recommend interchanging LD/HD in either direction. (But if you consider their potential liability for bad product advice, they would probably be less than prudent to recommend otherwise.)

Do you have many HD disks that you have used with Atari DD and kept for years?

And more than one brand?

Larry

i noticed too that "some" spartados utilities (actually most command
line utilities for even OS/A+ & DOSXL) will work with BeWeDOS. Now,
if we can get an HD init program developed for it, then it'd be tops.

Message-ID: <20021206095757.28149.00000305@mb-cf.aol.com>
Source record: 25294

I see that the HRDs are still being sold for 360K drives. While these may or may not be a good substitute for an analog alignment disk, they have been sold and used for quite a few years. Has anyone here had any experience with these?

see: http://www.accurite.com/FloppyPrimer.html

Along a somewhat similar line, has anyone ever used a "known good" 180K or 360K disk written with a 1.2 meg HD drive to check or radially "align" an Atari drive? (The narrower tracks could be of benefit in doing a rough alignment (without a scope).

Larry

I too have been looking for a supplier of 5.25" DSDD disks. Here
below is a cut and past of an online company (Athana) who sells them.

Thank you for your inquiry. The pricing for the 5.25" unformatted
discs (10 per box) is
as follows:

Qty. 1-2/bx 3-4/bx 5 +
$5.95/bx $4.95/bx $4.50/bx
plus shipping. We accept major credit
cards visa, MasterCard and American express.

It should just work - you don't need to do anything to get it working and it should work with any game a joystick will work on (Although some games need a real joystick to be playable). I have a Wico Trackball also.

6979. Re: BeWeDOS vs. SpartaDOS

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-06 16:14:22 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <asqi9v$1ir$1@reader08.wxs.nl>
Source record: 25200

I guess the best idea is to modfiy the code of FMTDIR made bij Bob Puff.

I'm not sure there is a source code available. The FMTDIR software doesn't work with MyIDE, but it does work with blackbox, AND with .ATR images!

If you want to check it out, surf to:

http://nleaudio.com/css/Files.htm

It runs on BeweDOS, but it doesn't support the myIDE interface (and it won't run on the emulator)

With MyIDE and on the emulator this software gives the error:

Shows Multiple tracks...

Strange.

I did format a 65535 sector partition on bewedos with this software.

Marius

Same here. My Wico Trackball works with anything that uses a joystick. Used to have fun playing Ball Blazer with it. I would see if the cable is ok by testing that or it could be that the emitter or receiver diodes are toast. But since you don't have x or y movement I would think maybe the connection or the cable are at fault.

Thanks, Ron. How does one use the cold start switch on the Axlon? This
would be the first time I ever heard of such a thing.

No, MyDOS's DUP.SYS has its rear end hanging out to around $4500 or so,
but that's not a detrement to using the ramdisk when it 'home banks'
correctly. The ramdisk handler is in DOS.SYS which is far enough away
to never cause troubles - one does not want to have the ramdisk configure
code hang over into $4000 region though. That code _is_ in DUP.SYS.

Sorry, Mathy;
It is the 800 with cold start switch; the Axlon is just a stock 128K Ram
board with a switch to allow it to appear as a normal 16K 800 card.

A quick groups.google.com search shows that he has posted 30
messages since November, 2001, and only two are not advertisements.

Actually, it a looks like he doesn't advertise nearly as much
as it seems... :-)

Anyway, I do appreciate all the vendors of Atari equipment, and
wish Ben the best of luck.

Let me say, as a diehard 8-bit fan, that I admire and respect a person who doesn't give up on supporting something that is pretty much fading away to nothing. I am sure it takes alot of effort to keep something going when there seems like there is no one out there who really cares. I do my best to keep in touch with the 8-bit community but it is hard to do when you got other things to take care of so I can see where you might be coming from too.

Let me say, as a former bbs sysop, Good Luck! I agree with other statements here that the Atari bbs scene is pretty much dead. I don't think it will ever make a come back, although I kind of wish it would. I don't think some people really realize what it takes to keep a bbs running. Only a sysop really knows. It's more of a dedication and also a time-consuming chore to keep it going and most of us just don't have the time to do so or sometimes the money it takes to keep the phone line going. I hate to say what I forked into this endeavor to keep this Atari 8-bit bbs alive and going when I acquired it in 1994 after it was put up for sale. I bought the bbs and also all the 8-bit stock he had. Boxes and boxes of docs, disks, equipment, etc. I paid $1500 then for all this stuff!!! Now, am I an Atari addict or what? Don't answer that! LOL

I wish I could have done more for the bbs world but it was just too time consuming for me and I had other things more important to do so I never had much time to work on my bbs when I took it over. It went down hill some then, and it got worse as time went by. 2 or 3 callers a day... that's it!! Why keep a bbs running even, just for 2 or 3 people a day? Not feasible and more time-consuming than it would be worth and the cost of the phone line too.

I, however, would have kept my bbs running probably as long as I could, if it hadn't died on me. Infact, I, actually, did my best to keep the bbs world going! I was part of the USF, if I remember right, United Sysops Federation, and I arranged and was pretty much in charge of what was left of the bbs network back then... about a dozen or so bbses in the States and Canada and a bbs in Canada did networking with bbses overseas which were about a half a dozen or so. I was also given the responsibilities of being NWPACs bbs replacement when they took their bbs offline and they donated all of their equipment to me. Well, the club folded not long after that. Then my bbs crashed not long after too! ;-(BTW, I am the owner of 3 nodes!! Iron Horse BBS, node 381, PAUGS BBS (NWPAC club), ???, and another node which was assigned to me when I finally bought an upgraded version and registered the node I was running to satisfy KP products.

The blackbox that my bbs was running on died. I don't know if it is the power supply or what. I still have not got a replacement power supply to

find out. It just went into storage and has been there ever since. I have stuff on it that I wish to get to, but I don't know if I ever will or if I ever can. Having the information retrieved from the hd would be expensive. I have 2 other hd's too that were not connected to the bbs. However, I don't think there was much on them.

Anyways, I don't know how much or how far Pro has progressed since I last seen it or used it. You did do a version for the PC platform, right? Well, stick with that then and try to make it as user-friendly as possible and easy to set up and get it running. I remember that some things were difficult to do in the older versions on the 8-bit because you had to set up cmds, etc, to get things the way you wanted them and you also had to make screens too... which was a bit time consuming. Trying to work with all the available modules was just too much to wade through and find one just right for me to do what I wanted it to do. At this point, I agree with others, trying to work on the 8-bit version may just be futile. Maybe for the PC version too, but that's the preferred platform nowadays!

Nite Hacker

All BBSes require some setup and configuration, even the PC ones.
Heck, that's part of the fun!

Another bit of atari 8-bit networking nostalgia was that for a while
we had a QWK Net set up that included an Oasis BBS in NZ as well as some PC
BBSes here in the states. QWK was the universal network packet format that
all our computers understood. While this facilitated inter-platform
networking, for the users we had some nifty features as well. They could
call in, tell the BBS to create their QWK packet and immediatly log off.
This would save them LD charges because they would be logged off while the
BBS was creating and compressing the QWK packet. The next time they logged
in their QWK packet was immediatly presented to them for downloading, which
after they did that they could once again log off, view and reply to the
messages using their QWK readers, and later upload their replies. This was
about as good as it got, before the Internet took over.

I guess it depends on the programming. I have seen good and bad
8-bit and ST versions. But all of them are still fun to play.

Thanks to all the entries to my '3 CD's of Atari programs' draw on my website. I was surprised by the number of entries, and may award a 2nd prize.

The Winner is: Steve S. of Las Vegas. The 3 CD's will be sent off to him very soon.

Thanks to all the support from everyone over the past 5 years, with my website. It's great to see 'most' Atari enthusiasts still working together. Although I'm closing the website very soon, I will still be around to help out with programs you may need. Just email.

Let me be the first to say to everyone....

Have a safe and happy Christmas and New Years!!

And remember... if you drink....DONT DRIVE, stay alive, to boot your Atari another day! ;-)

Regards,

Aaron Wheeler (aka Holmes)

Well, takes a real diehard Atarian to run a bbs and someone that has the time to do so. I tried but it was just a little too much for me to handle. I liked it and I wanted to make some improvements to it but I just never had the time to do so. I kinda felt like a failure too for not having more time to devote to the bbs, etc. Well, it was fun while it had lasted. I would probably have kept my bbs running longer had it not crashed on me. I got disappointed and discouraged at that point and I also felt what is the use to putting it back online just for a few callers a day. I think I lost my phone line not long after that, anyways. Oh well, those were the days!

Oops, sorry about that...

Well, then a PC version of Pro would be nice! :-)

Well, I won't expect that... I know that would probably be too much to do and may not be worth the time and the effort due to lack of support but I wish him well and give him thanks for hanging in there and keeping Pro alive and for his support to the 8-bit community!

Awww, shucks! I missed another cat fight!! Darn! I wished I had been here to see it! LOL

Yep, that's the norm for newsgroups and any other kind of message board, for that matter.

Unfortunately, I am quilty in having been caught up in one or two of them myself when I was running my bbs. The message boards would get pretty heated from time-to-time and there was a KP Products/Pro fiasco back then too. Some people that are here, who shall remain nameless, probably remember that all too well! Nice to see that some things, don't change... NOT!!! LOL Not much you can do about that. Best thing is to ignore it and maybe it will go away real soon. If people respond to this crap, then they are just adding more fuel to the fire and also giving the other person an audience to where they can continue to perform or show off what little brains they may have left! On the other hand, maybe people do this because it's the safest place to blow off stem and not get physically hurt in the process.

Either you enjoy the side shows or you just ignore them! :-)

#1 Tip -
Need I mention this, another highly recommended tip, *ALWAYS* have a back-up of whatever file you use in your emulator, atr, bin, exe, etc... Not saying that the emulator purposely messes up files, but they can get jumbled up and won't work the next time you try to use it, especially your atr (disk images), if it locks up or you have a wrong setting, etc. I have had my MyDOS disk crash on me several times and had to go back and copy from the original. So beware and be careful!

I am so thankful for Atari800Win.... it is by far the *BEST* emulator out there!
I like it, especially Plus 2.8, because, if you know what you are doing, you can make individual setting files, in the form of reg files, to pre-load settings into the registry and then start it up and you have whatever you want loaded and ready to go! This is great, especially if you can't remember the settings for a game or program and later you want to use it but forgot the settings. You can set this up to load game disks with menus on them and then you just pick the disk you want... ie Games001.reg and start the emulator and the disk automatically starts booting up and you can pick your game and you're off and running!!! Seems like I downloaded 3.0 or 2.9? just recently and looks like things changed to where I could not use my system anymore. :-(I am going to check it out again and hope that it still will work the way I want it to.

Glad to see that you can now use your rom or bin cart files from SpartaDOS, Action, etc!

7004. Re: XFD - DCM - ATR - SCP

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-08 10:41:47 UTC
From: Nite Hacker <nitehacker@hotmail.com>
Message-ID: <LIFI9.14710$jf7.762121@news2.west.cox.net>
Source record: 25225

It is all a matter of how you are storing them and how you are using them and how accessible you want them to be...

Most common formats seem to be XFD, ATR and DCM. SCP has been rarely used.

Another common format, which was neglected to be mentioned by anyone here is the ARC format too.

It depends on what system you are using and storing them on....

If you are using a PC, then using ATRs or XFDs (not compressed) is the best format for the emulator, Atari800Win, of course! :-) Although DCMs are useable too, they are not easily to work with, since they are compressed, as if they were ATRs and you have ATR utils. So, if I were you, I would stick with ATRs and maybe XFDs since they are the easiest to work with and stay away from using DCMs since, if you want to modify them, you have to first convert them to the ATR or XFD format. Unless there are DCM utils that I don't know about? ATR utils are easily available and most are easy to use... ATRUtils by Ken Siders is a good one. Once you have your ATRs and/or XFDs, which are not compressed, then you can gzip them, I believe, and they can still be used in the emulator in the zipped state, gz. Or you can just simply ZIP them and unzip them when you need them. I am not familiar with gzip but I am sure you could find a program that works with this format. Winzip will read gz files but I don't think they will make them. I don't know the format of XFD files but I do know, like other people have said here, an ATR file is in raw (original) form as if it were the real disk, once you take away its 16 byte header, which seems to be the same(?) on all ATRs. So if you want to make an ATR, all you have to do is extract the 16 byte header from another ATR file and add it to the raw data that was extracted from a disk and you should have a working ATR file! Or just make it easier on yourself and use an ATR util like the one I mentioned above and create the image that way. So, obviously, ATR format was meant for the PC.

If you are using an 8-bit, DCMs and ARCs are the most common. Both are compressed with, I believe, ARC being the best compression method. You can store *ALL* your disks and files in ARC format and that will allow you to store more on one disk. You could, theoretically, have several disk games (depending on the size of them) stored on just one disk for storage purposes. You have to be sure and analyze what you are compressing first to make sure what the best method is to use. Alot of games, unless they have been cracked, are bootable disks and rely on the boot sectors to work properly. So, the only way to capture the boot sectors is using DCM. After that, then you can even ARC the DCM to make it more compact for storage purposes. One thing about DCM, the file extension comes in a variety of flavors, so they can be DC3, DCM and I think DSK and maybe a couple of others that I can't remember right now. If the extension starts with a D or

it has a 3 in it, then you probably have a DCM file. Doesn't hurt to try it! The ARC format, of course, is best for storing files. That's all there really is to ARC and DCM files. Just get Discomm (Disk Communicator) and SuperARC/UnARC and you are set to go!

The best thing about ARCs and DCMs is that these files are easily transferrable and useable between the PC and the Atari, if that is what you are after. DCMs can be directly loaded into the emulator, Atari800Win. ARCed DCMs just have to be unARCed on the PC using the old favorite, PKARC, before loading into the emulator. The only thing left is ARCs that contain just files. Depending on what kinds of files they are, you can directly load them into the emulator, ie com, bin, or exe. Or you have to make an ATR/XFD with the files or make a virtual disk in the emulator to access them.

Well, I will conclude my dissertation for now. I hope it's not too much information or an overkill. I hope you have found this to be helpful.

Here is another place you can go and check out more information on the different disk image formats so that you can better understand them and make a better informed decision

http://www.atarimax.com/ape/docs/DiskImageFAQ/index.html

It's really a matter of taste and how you want to store them and use them.

Happy 8-bitting!

> Not any off-hand that use synthesized. I know there are, I just don't
> know them off-hand. (Most probably utilized SAM)

I know of one game that utilizes SAM... it's called POKER SAM. It's a bit funny too. If you take too long to play... it will make funny off-the-wall remarks. I can't remember them, but some of them were a bit funny. You have to start a game and when it's your turn, just sit back and listen!

What is the difference between synthesized and digital? I thought they were the same?

Anyways, I like digital... like on the title screen of Ghostbusters and then when you get slimed and it says: He slimed me! I don't recall too many games using digital. Do you?

Happy 8-bitting!

I have two 800 XL's that are in great condition. Both were bought off ebay
and both do not work. The first has memory errors, so I bought a second, not
wanting to give up on the atari after being a sinclair person for so long,
but this unit locks after 60 seconds of use.

Does anybody have any idea what is causing the problem. Is it that the 800xl
was such a c**p machine?
Is there anywhere in the uk that would fix these machines?
Please help....

Hi,

Yes can be done, spartados can handle upto 8Mb files.
But color I don't know.

I know there are convertors for gr.8 to characters. Then each screen is
about 1Kb and fonts can be reused. I think something like that was done in a
Polish demo I saw some time ago. They packed a 3Mb demo to less then
320Kb.... so think how much you could put in 8Mb...

Yes, I was in the USF and kinda was in charge of the US network and there was a bbs in Canada that handled Canadian side of things and then there was the overseas connection which included you and several other bbses. One of the Canadian bbses handled the overseas link. I think, if my memory is right, that was about a total of 15-20 bbses back then. Those were the days! :-)

It's all digital since it's digitally recorded on magnetic disk. The difference would be between 'sampled' and 'synthesized'. Sampled means it was recorded from a source and then played back, like a second or two of a tape recording saved to disk and called back by the software and played. Synthesized is created entirely by software and hardware working together to form sounds like high speed beeps and buzzes that sound like a spoken word.

> Are there any examples, playable via emulator, of synthesised speech on
the
> Atari XL?

Well, what do you mean synthesized or digital, or does it matter? There seems to be a bit of debate on this here, right now. I don't know what it all means even. Anyways, yes, several of the games has either digital or synthesised and, yes, they do play in emulation mode. Atari800Win is the choice of emulators for the 8-bit and it is almost perfect in emulating everything to a T! I don't know or remember all the games that do have it or that work in emulation. I do remember that Berzerk does and Poker SAM does too. I am sure there must be several others that work too. As I said, this emulator works with just about anything!

Happy 8-bitting!

Hmmm... maybe I am thinking of the C64 version. I don't remember, now, if
the Atari version had it or not. I think it has the title part...
Ghostbusters (Hahahaha)...but I don't know if it had the "He slimed me!".
Have to check it out.

Happy 8-bitting!

Oh, OK, I think I am beginning to see the light at the end of the tunnel now! So, then, most of the games, etc, that have a voice in it are actually samples... like Ghostbusters, Berzerk, etc, right? Whereas, SAM is synthesised, right? What about Poker SAM? Would that still be considered synthesised or was it samples that were made from SAM and added to the game?

Happy 8-bitting!

Oh, OK, cool!!

Sorry, I have been out of touch for awhile and I did not know how far Pro has progressed. I vaguely remember seeing some info on it at one time awhile back but I did not remember whether it had progressed to the PC platform or not. I am glad to see that there is a PC version! Maybe when I can, I will purchase one. What is the going price on it? Is there like a reduced price for someone who owns Atari versions of Pro?

Happy 8-bitting!

> Does anybody have any idea what is causing the problem. Is it that the 800xl
> was such a c**p machine?

That is far from the truth!!! 800XLs, or just about any other model, are *NOT* crappy machines! Infact, they are usually quite the opposite. They are almost like a Timex watch... they take a licking and keep on ticking! They were designed and built well with, usually, quality parts that were designed to last a long time. I hardly have had one to fail on me! You can easily upgrade/modify them, if you know what you are doing, etc, and they don't mind being invaded on, and they still run forever and ever.

First of all, I am not or don't profess to be an expert but from years of experience I can tell you the basic steps of trying to solve your problem. First, start with the power supply. It may not be the problem, but depending on the model of power supply, then again it could be. Some models tend to get flaky. So, just to save you lots of headaches and time, start with it. If you have a spare one, try it. If not, you can buy a spare. They are not that expensive. Or maybe you can check it out with a meter if you know how to use one. I have had a faulty power supply before and it did strange things to my computer and I thought I had a faulty computer.

If that is not the problem and if you are not afraid to, or you are a tinkerer, then you can open up the case yourself and look at the board and see if the memory chips and OS chips, etc, are socketed. If so, then, usually, just pressing down on each one to re-seat them might cure the problem. Or, carefully remove each one and put them back in and press on them firmly back into place.

If after you done this and it doesn't solve the problem, then, usually it's a faulty chip that is causing the problem and it's time to try to diagnose which one it is. Start with the Self Test module of the computer. Boot the computer with the disk drive off to get to the Self Test. This can actually help you determine where the problem lies. It will show you whether it's a system rom chip or it is a memory chip or maybe the sound chip (Pokey). This is as far as my expertise goes as I don't know how to interpret the test results. I am sure someone else here probably does and can give you further assistance from here if you got this far and are still stuck. I have seen, somewhere, a list of problems and possibly the resulting faulty chip but maybe, at this point, it would be best to hand your machine over to an expert if you cannot do it yourself because soldering might be required to remove a faulty chip and replace it with a new one or it may not even be a faulty chip?

Well, hope this helps a bit... I am sure someone else here can probably be of further assistance to you!

Whatever you do here, *DON'T* give our Atari 8-bits a bum rap anymore! LOL
They are really good quality machines... better than a Commy machine! :-)

Happy 8-bitting!

Will the Atari DOS diskettes work as a DSDD disk?
I don't remember if you can get them to or not. I think I sort of tried it
out one time but it did not work. I think it had something to do with
needing a timing hole and I don't think they have one?

Well, just wondering as I know that B&C Computers has a boat load of them!
You can get 1000 of them for only $100 (10 cents each)! You can buy them in
smaller quantities too, such as 100s or 10s.

Happy 8-bitting!

Berzerk was Sythesized. Most everything done today is sampled since it is easy to do, sounds human (Because it is), and the computers have the memory and storage to hold everything needed to say. Synthesized speech needs to have enough memory to make all the sounds nessesary to pronounce the words, but could pronounce an unlimited number of words since they are sounded out as needed. I beleive Berzerk was the very first arcade game to use speech. It seems like not too long ago I was having S.A.M. pronounce all the swear words. It deffinately doesn't seem like the 20 years it has been. And in 20 with all the advancements, I don't think I will ever have as much fun with a computer as I did with my old Atari.

2002.10.14 removed B. Utschig
2002.10.12 removed Z Systems (dead web site, no other contact info)
2002.10.12 Mark Grebe updated (Atari800MacX 0.2.1)
2002.10.12 DGS updated (CD-ROM #2)
2002.09.30 Marek Mikolajewski/SIO2IDE updated

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: July 15, 2002

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

7030. Re: Axlon memory upgrade question

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-09 11:51:38 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <at204b$m4e$1@nets3.rz.RWTH-Aachen.DE>
Source record: 25151

Howdy Ron, folks

> Sorry, Mathy;
> It is the 800 with cold start switch; the Axlon is just a stock 128K Ram
> board with a switch to allow it to appear as a normal 16K 800 card.

That was Lee, not me. :-)

CU Mathy van Nisselroy

> "Lee" <melee5@my-deja.com> wrote in message
> news:a57ea28d.0212061651.ed11aa8@posting.google.com...
> > Thanks, Ron. How does one use the cold start switch on the Axlon? This
> > would be the first time I ever heard of such a thing.

7031. Re: BeWeDOS vs. SpartaDOS

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-09 11:54:52 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <at20ad$m83$1@nets3.rz.RWTH-Aachen.DE>
Source record: 25152

Howdy Marius, folks

> I guess the best idea is to modfiy the code of FMTDIR made bij Bob Puff.
>
> I'm not sure there is a source code available.

It isn't available. Bob only put HDFMT and PARK code up on his site, not
FMTDIR. But you can always ask him. But don't expect him to answer soon.
His daily business keeps him pretty occupied.

CU Mathy van Nisselroy

7032. Re: atari trak-ball (wico) HELP!!!

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-09 12:01:54 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <at20nimmu1@nets3.rz.RWTH-Aachen.DE>
Source record: 25153

Howdy JP, folks

> - Write a small routine in BASIC that will show you the values for pins
1-4
> on the joystick. (If you don't wanna write one yourself ask me and I'll
> look for the utility I used. It might be in TurboBASIC though)

I found the above mentioned utility. It's in BASIC. Will test pins 1, 2, 3
and 4 only.

```
5 REM ST MOUSE TESTER
6 REM by M.G.F. van Nisselroy
7 REM
100 X=STICK(1)
150 X=X+1
180 LOWER=0:UPPER=0:RIGHT=0:LEFT=0
200 D=(X/8)
240 IF D>1 THEN D=D-1:LOWER=1
300 C=((D*8))/4
340 IF C>1 THEN C=C-1:UPPER=1
400 B=((C*4))/2
440 IF B>1 THEN B=B-1:RIGHT=1
500 A=((B*2))/1
540 IF A>1 THEN A=A-1:LEFT=1
600 ? LOWER,UPPER,RIGHT,LEFT:GOTO 100
```

You can cut and paste it to a file. Then transfer it to your ATARI (don't
forget to translate all CtrlM/CtrlJ's to Atari EOLs). ENTER it into the
computer.

CU Mathy van Nisselroy

PS if you remove the ball (make sure it doesn't roll of your desk/table) you
can check each direction individually. Wit Mice, you can use a ruler to
make sure the mouse only moves in one direction.

7033. Re: Disk drive repair

Newsgroup: comp.sys.atari.8bit

Source record: 25155

Howdy Zothen Runecaster, TXG, folks

Check out this file on my site
http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm#realtime_video
This is what a C64 guru thinks about what could be done on a C64 (which runs
at 0.9xx MHz). Surely our trusty Atari can do it if the C64 can.

BTW if you read over it. A REU (mentioned in the file) is a RAM Extension
Unit. A link to this guru's site is under 'Webcam' (use link above)

I think you confused us with the
comp.sys.atari.8bit.just.won.the.lottery news group.

I'd go back to look at more realistic pricing as people will look at
the prices and your comment that these are 'expected' prices and just
not bother to offer at all.

I've done a number of upgrades to XE machines. I suspect you've pulled up a trace or two while desoldering. What I would do is use a multimeter to check each trace from chip-to-chip for all 8 chips and 16 lines. You should see one of my Xe's. Under the board are several 'patches' I had to make to correct broken traces. I did a very poor job of desoldering the drams on that one...

Heck man, 71256 256k-bit chips are a dime a dozen. I'd desolder all 8 and replace them with the 71256's. If they work and you have no furthur trouble, I'd then go ahead and do a 320k Scott Peterson upgrade to it.

The 71256's will work just fine as a 64k bank, you won't get to use the full ram til' you do some mods though.

I have an Atari trackball that has a switch on the bottom. In one mode it is an analog trackball and in the other a trackball joystick emulator.

A joystick uses different pins on the connector than a real trackball which is what you have.

You can test it using Basic.

Something like:

```
10 x=paddle(0):y=paddle(1): print X,:print Y,: goto 10
```

Run this little program with the trackball attached to port 0 and fiddle with the ball. The values printed on the screen should change in a predictable way when you move it.

BTW, group? Am I blowing smoke here? I do think that it uses the paddle a/d inputs but am I right?

Probably not very well. The Ataridos disks were rated at single-sided,
single density and since Atari bought them from the lowest bidder, I
wouldn't trust them at even SSDD much less DSDD.

Anybody out there remember the guy we all loved to hate in the BBS message bases? He was the perfect flamer. Bad grammar, couldn't spell for Sh*t. He kept the bases hopping.

I was reminded of him the other day when I was reading a docfile I'd written a long time ago.... Here's a quote:

On This Day modules for Carina 2.x written by Technoid Mutant

This program is in the Puplic Domain and may be distributed freely. No payment is required for the use of these programs or data files.

For Terry Ortman and "Star Fleet Software" only, the sum of $5000.00 MUST be paid to the "People with Aids Coalition" of Miami, Fl. if he is to use, distribute, or posess these programs or documentation.

Have you ever been even slightly jealous of those BBS Express PRO! sysops and thier toy modules? Well, I have and that was what inspired this program......

I giggled for an hour. Oh how we HATED him.

Regards,

Jeff

You got it.

A 130XE-COMPATIBLE 256K UPGRADE FOR THE ATARI 800XL
by Claus
Buchholz

I designed the 256K upgrade described in my article, "The
Quarter-Meg
Atari" (BYTE, September, 1985), in December, 1984. Since this predated
the
130XE, there was no precedent for extended memory on the XLs. I felt free
to
implement a system of eight 32K banks. The major reason was to keep
the
add-on circuit as simple as possible.
The 130XE, introduced in early 1985, set a different standard
for
bank-select memory. It uses 16K banks and makes them separately available
to
both the CPU and the video controller (ANTIC). The XE has 128K total
memory.
The 64K extended RAM is split into four 16K banks.
A 256K 800XL has 192K extended RAM, which requires 12 16K banks. I
have
designed a new upgrade for the 800XL that implements such a scheme.
Its
similarity to the 130XE's scheme allows use of software for the XE on a
256K
800XL.
To select one of four banks, the XE uses two bits, #2 and #3, in
the
memory control register (port B of the 6520 PIA, addressed at $D301 or
54017
decimal). Zeroing bit #4 makes the selected bank appear at
addresses
$4000-$7FFF (16384 to 32767 decimal), as seen by the CPU. Zeroing bit
#5
makes it appear there as seen by ANTIC.
In my upgrade, bits #2, #3, #5 and #6 select one of the twelve
banks.
Zeroing bit #4 makes the selected bank appear at $4000-$7FFF to both the
CPU
and ANTIC. So, any program for the XE that uses the extended RAM for
CPU
storage will work on an 800XL with this mod. Those programs won't use

the
additional 128K, though. Programs that use the video banking feature of
the
XE might run on the modified XL, but the screen display will be wrong.
The procedure for this upgrade is basically the same as in the
article,
except for the following points. If your ANTIC (U7) part number is
CO21697,
use the circuit described by the first connection list below. If it
is
CO12296, include the circuit in the second list. The circuit requires
five
connections to the PIA (U23). So, pins 12 through 16 must be bent up
and
connected to the circuit. The rest of the procedure is the same. Notice
that
this circuit has one more chip than the article's circuit. This is the
price
of compatibility.
With the 256K dynamic RAMs in your XL, be sure to wait at least
ten
seconds after turning the computer off. Otherwise it may not
coldstart
properly when you turn it back on.
My original RAMdisk software doesn't work with this new mod, so I
have
written a new version. It is used in the same way, except that it offers
a
choice of either two single-density RAMdisks or one double-density. If
you
wish a disk copy of the source and object code, send me a blank disk
and
return mailer with full postage, and I will promptly send it back with
the
software. Alternately, you may download the software from the Capitol
Hill
Atari Owners' Society BBS at 517-371-1106 or from the Castle
Communications
board at 517-371-4234. The source file is called QMEGXLD.SRC for
Quater-MEG
XL Double.
Also available is a RAMdisk program that sets up one
single-density
RAMdisk and leaves the XE-equivalent banks free for XE software. This
is
quite useful with BASIC XE, DOS 2.5, or the new Synapse software. Its
name
is QMEGXLS.SRC.
I ask one thing in return for this information: Please pass it
around

to all your interested friends. Put it in your club's library or on
your
favorite BBS. Encouraging software support of 256K will result in
many
interesting uses for it. Thank you and enjoy!

DEFINITION OF MEMORY CONTROL REGISTER AT $D301 (54017 DECIMAL)

XL MOD 130XE

bit: 7 6 5 4 3 2 1 0 bit: 7 6 5 4 3 2 1 0

video
abcd is 4-bit extended RAM bank # C=0 enables extended RAM for CPU
- ranges from 4 to 15 xy is 2-bit extended RAM bank #
- banks 12 to 15 are equivalent - ranges from 0 to 3
to XE's banks 0 to 3

PARTS LIST

8 41256 256K-bit dynamic RAM (200ns or less)
1 74LS153 Dual 4-to-1 multiplexer (IC2)
1 74LS139 Dual 2-to-4 decoder (IC3)
1 - 33 ohm, 1/4 watt resistor

ADDITIONAL PARTS FOR ANTIC #CO12296

1 74LS158 Quad inverting 2-to-1 multiplexer (IC4)
1 74LS393 Dual 4-bit counter (IC5)

LIST OF CONNECTIONS FOR THE UPGRADE CIRCUIT

Instead of a drawing of the upgrade circuit, below is a list
of
connections. Each entry in the list begins with the name of the
signal
followed by all the IC pins that connect together and share the
signal.
IC3-13 means pin 13 of IC3. The IC numbers appear in the parts list
above.
IC1 is the 74LS158 chip from socket U27 on the XL motherboard. DIP is
the
DIP header to be plugged into socket U27. U23-xx refers to the pins you
bend
up on the PIA chip at U23 on the motherboard.

Vcc : DIP-16, IC1-16, IC2-16, IC3-16, IC3-13
Vss : DIP-8, IC1-8, IC2-8, IC2-1, IC2-15, IC3-8
A7 : DIP-11, IC2-10, IC2-11

A15 : DIP-10, IC2-13, IC3-3
A6 : DIP-14, IC2-6, IC2-5
A14 : DIP-13, IC2-3, IC3-2
MUX : DIP-1, IC1-1, IC2-2
A4 : DIP-2, IC1-2
A12 : DIP-3, IC1-3
RA4 : IC1-4, DIP-4
A5 : DIP-5, IC1-5

A13 : DIP-6, IC1-6
RA5 : IC1-7, DIP-7
-E : DIP-15, IC1-15
RA7 : IC2-9, DIP-9
RA6 : IC2-7, DIP-12
PB2 : U23-12, IC2-4
PB3 : U23-13, IC2-12
PB4 : U23-14, IC3-1
PB5 : U23-15, IC1-10
PB6 : U23-16, IC1-11
-Zd : IC1-9, IC3-14
-O1a : IC3-5, IC3-15, IC2-14
-O2b : IC3-10, One side of resistor
RA8 : Other side of resistor, Pin 1 of all RAMs

If your U7 part number is CO12296, do not connect signal A7 above,
and
make the following additional connections. The connection to U7 is to
a
trace on the motherboard that runs from pin 8 of U7.

Vcc : DIP-16, IC4-16, IC5-14, IC4-3
Vss : DIP-8, IC4-8, IC4-2, IC4-15, IC5-7, IC5-2, IC5-12
A7 : DIP-11, IC4-6
-REF : U7-8, IC4-1
REF : IC4-4, IC5-1
A7' : IC4-7, IC2-10, IC2-11
Q7 : IC5-8, IC4-5
Q3 : IC5-6, IC5-13

The .XFD is just the raw disk data without that 16 byte header on the .ATR.
Be careful using this method tp make new .ATRs such the 16 byte header is
from an image of the same density as the header contains configuration
parameters such as bytes per sector and total sectors.

7052. Re: Holmes Atari Games Website CD Draw

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-09 15:11:28 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3df4b144$1_5@news.teranews.com>
Source record: 25173

I have access to a commercial CD copier and plan to make the CDs available to anyone who wants one if they are willing to pay the cost of shipping, copying, etc.

I am thinking about using ebay so that everyone can be assured that their payment and delivery is guaranteed, but due to the contents of the CD I am a bit reluctant. Furthermore, I really do not want to use U.S. mail for legal reasons, so delivery may be limited to a private mail service (UPS, FedEx, etc.) in the U.S. only.

I may use a software sharing program (like winmx) to allow people to download as well, or even put the CD images or the ATR images on a web page.

Basically, I was just determined to keep something of Atari going. Back in the 80's, I watched as Atari died slowly as business after business which supported Atari closed down and stopped supporting it. It was a sad. I see the same happening still, if it was not for the internet, it would be gone all together.

Holmes had the best, most well organized, and most complete web site of anyone else out there, with a little luck, perhaps I will be able to re-open it to some degree. Being a student gives me a little more time than most.

All of this, of course, if Holme's has no objections. After all, this is all originally his own work, I only wish to prevent it from dying.

I was pretty determined to win this one because I wanted to be sure that not only will I continue to have access to the Atari programs, but so will everyone else. I sent in a whole bunch of unique individually hand written post cards with it's own international postage, which ended up costing me quite a bit.

Hi, Gary;
All of my 800s and XLs, except for one 600XL bought cheap just for the power brick, are still cranking after 18-20 years and are very rugged and well built.

That "60 seconds" certainly sounds like a heat related situation and is very possibly a marginal contact to a socketed chip. You might want to remove and reinstall or at least push down all of the Ram and other chips.

7055. New Video Cable

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-09 16:17:58 UTC
From: llppwhite@aol.comnsp
Message-ID: <20021209111758.26428.00000116@mb-ft.aol.com>
Source record: 25176

In my quest for "ultimate video" from my A8 system, I made a new cable over the weekend from an X-Box accessory cable that is of excellent construction. It has S-Video, composite video, and left/right audio. All leads are individually shielded and covered in plastic, then the whole thing covered in plastic (of course) and there is a toroid at the input end. The console connector is naturally completely different from the A8, and I ended up cutting about 2 ft. from the apx 6' cable and clipped my old A8 video cable about 4" from the DIN connector and then spliced/soldered all the appropriate leads.

All-in-all, the results were an improvement over my (almost) original cable -- the video is clearer and virtually free of the "pulsing" that I had mentioned before, but the little vertical background lines are now clearly visible. The composite is also definitely clearer, but still of lower definition that the S-Video. The vertical lines are not visible with composite, but I would presume that they are simply "blurred" out.

Because of the big video game console market, cables like these are abundant and reasonably priced. This one was $9.95, and I've seen others for as low as $6.95, but not as high quality. If anyone else is on a similar quest to clean up the A8 video, I'd be most interested to hear of your efforts.

Larry

Yep,
many Atari 400/800 games were updated for the VCS 5200. You know that
the 5200 should compete against Colceco, Intellivision and other
consoles at that time. Why there haven`t been any updates for the XL or
XE computers - I don`t know. At that time Atari was kinda split into the
console developers and computer developers. Thanks to Glen the 5200 man,
at least some 5200 games can be had on the 800/XL/XE too. It is a little
sad that not every 5200 game was brought to the home computers then. And
furthermore almost no-one seems to know how to convert 5200 games to the
800/XL/XE computers. Maybe Glen was a frustrated ex-Atari
engineer/developer?!?
-Andreas.

Not completely clear exactly what you are seeking... Any direct connect printers like those from Atari and early Axiom and Okimate offerings either used a standard SIO cable or a hard wired one on the printer.

The 825 had a card edge for the printer end and D15M sub-mini at the 850/PR: connection. Most of the other interfaces used SIO connector at the XL and standard Centronics 36 type at the printer.

Thanks for he response.

I have attempted some of the thinks you have suggested.

The power supply reads 5.49v constant and does not change at all after 2 hours of continued effort.

I have opened the computer up remove the board and shielding and connected it to power and tv. Seemed fine and I was able to type in a simple for next loop. Ran the loop and it halted at 220..... Switched off, waited 30 seconds switched on to be met with a dark red screen. Switched off then on. Met with a blue screen and white cursor. Finally informing it was ready after 10 seconds. But would not respond to keyboard.

The board has 5 socketted chips 4 large and a smaller one. None of the memory chips are socketed. All are well into their sockets ad a firm puch on each confirmed this to me.

Still no joy thou. I think I will place these things back into their boxes and place them into the loft.

Could it be the basic rom on the board that is the problem? I am able to play my pacman cart for quite some time with out any issue....

Thanks again

Gary

I'm probably missing something. All 5200 specific games were converted
to 8bit except for 2:
1) Meteorites
2) RS Baseball.

I converted RS Baseball, but after seeing the stick overlay - too many
buttons there - I gave up. The game would be unplayable with keyboard.

Hi,

Few weeks ago I asked at AtariAge.com for some info about mysterious AMY
music chip from Atari. Because there was almost no info about it, I
started a hunt for the info.

I was lucky to get contact with all the developers of that chip.

You can read more on my site (see sig). Go to Atari/8bit - Hardware &
technical info/VLSI chips/AMY. (I'm not putting link here intentionally
:).

Hi

I've managed to pickup a boxed Korean Atari XE from someone. The Korean power supply that comes with the system seems to be 220V and I wondered if anybody knew if this was compatible with UK power supply? Also does anybody know where I could get a cheap XE compatible power supply from within the UK?

Thanks
John

Hi,

I still have lots of new , boxed and shrinkwrapped ATARI XL/XE/XEGS
carts :

I sell these games for 3-10 Euro each , (=$3-$10) and I can ship
worldwide.I also have games with damaged boxes for lower prices.

All these games are new , no used games.

Ace of Aces
Airball
Archon
Ballblazer
Battlezone
Crimebuster
Crossbow
Davidï¿½s Midnight Magic
Desert Falcon
Eastern Front 1941
Final Legacy
Gato
Hardball
Joust
Loderunner
Millipede (large box)
Millipede (small box)
Moon Patrol
One on One Basketball
Pole Position
Rescue on Fractalus
Robotron 2084
RS Football
Star Raiders 2
Thunderfox
Tennis

Disk :

Microsoft BASIC
Mickey in the Great Outdoors

Cassette

Scram
Touch Typing

If youï¿½re interested , please contact me.

I doubt he, or anyone will get $180 for an ATari 800 these days. I picked up mine at a now defunct user group meeting 6 or 7 years ago. It had been in the warehouse (used for inventory database apparently) in Irwin Toys (the canadian distributor for atari from late 70's to early 80's before Atari canada) for years. I got it with a small Electrohome mono (green) monitor and an ATR8000 (& 2 drives) for the outrageeous sum of $25.

>

Oh, OK, thanks for that info. I never noticed or examined the differences between the densities. I don't really work with XFDs and I just usually use the emulator or ATRUtil to make my ATR files anyways. I was just pointing that out as a quick fix but he probably doesn't need that since the tools are readily available anyways.

Source record: 25097

Hi there,

Seeing posts bout James King & terry ortman in the past week or so got me looking them up on groups.google.com. All I can find of James King is some of the threads he posted in until 1994, nothing after that, maybe its a hole in the google archive, I dunno. As for Terry ortman it looks like he's been hanging out in the alt.fan.traci-lords newsgroup. Considering who Traci Lords is all I can say is "It figures". From the looks of things it looks like hes been up to his usual hijinks in that group as he was up to in the 8bit scene years ago. All I can say now is Nuff Said.

On a similar topic, Does anyone know what Wayne King is up to these days? if you dont remember he ran the Balmy Beach BBS in toronto and was in fido net (carried some atari fido traffic) and I think he also carried this NG as well. Last I heard of him was back in 95 or 96 when he took his board down since he was tied up with work at the time (I think he worked at the CBC back then).

bfn,
James

* Have You Played Atari Today! *

7078. Someone hang the previous managers of Atari

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-10 03:38:12 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3df5604a$1_5@news.teranews.com>
Source record: 25100

I remember the day, some time back in 1980 or so when we first received our Atari 800 computer. Since that day, the Atari computer as well as the computer world opened up to me and became integrated into my life.

The Atari computer was my learning partner, my companion. I became an exceptional programmer. I could translate decimal into binary, hexadecimal, and octadecimal in my head and in a large degree understood how it worked and what it meant.

My treasured book was "Your Atari Computer" and in the course of my life, I have owned three or four, as I would tear the book apart through so much use and reading.

I longed for other books "De Re Atari", "6502 Software Design", and "Mapping Your Atari" which opened up the realm of the Atari computer and teach me more about programming.

Whenever I could, I always viewed the code from favorite programs and games so I could understand how it worked and learn from the code. I learned so much in this way.

Atari was my hero and something that I learned to love and admire.

In my opinion, Atari made the biggest mistake when it left it's users cold. When the ST and other systems came out, Atari quite blatantly left everyone cold when it said it would not support the 8-bit computer anymore. (Apple made this mistake once too, and has never recovered) Betrayed and left standing in the cold by Atari, many customers refused to stay as they took off in the direction of IBM and Apple.

One by one, the stores which held Atari games closed or simply quit supplying the software. Atari clubs and BBSs struggled but were the only hope for keeping the machine alive.

In my opinion, had Atari created a way or method for backwards compatibility, they would have led the market and opened a door to stand even today. But there were many many more mistakes that Atari would make.

I am dismayed that one of my fondest memories had been managed so "piss poorly". If memory serves me right, Atari once traded on the NYSE. Now.... they it is just a name that is tossed around by larger corporation as they transfer ownership of the "name" (and that is all it is now, a name) from one hand to the other.

At one time, Atari closed their factories and laid off all their workers so that they could take their manufacturing jobs to third world countries. Their creation of the ABC computers was a complete flop. Not keeping with

the times, they built sturdy and "expensive" computers when the public was more cost aware. Atari had a piss poor marketing strategy, often refusing to advertise when it could have done them so good.

Atari was seen as a toy, more than the fine machine that it was. Another blunder of the Atari Management as they could have shown it to be so much more. A learning tool, a word processor, a graphics art studio, an accounting machine.

At one time, Atari planned to advertise on M-TV showing the Atari computer in it's musical abilities. Another screw-up caused this plan to die before it could take root. From what I can recall in the rumors that I have picked up, the person that started Atari even left in disgust as he left and started a "Chuck E. Cheese" food chain instead of trying to keep alive an already dying horse.

The managers of Atari should be horse whipped for giving such a fine machine and such a fine company, that had SO much going for it, such a bad name. They are the only ones to blame for the blunders that took place, and I hope they read this too. You guys are a complete "fuck up".

From: Steve S <j70141@hotmail.com>
Message-ID: <3df5642c$1_5@news.teranews.com>
Source record: 25103

Hi guys,
I have your emails. I just want to formulate a plan about how I am going to do this exactly before I respond.

btw, I was corrected by one person who told me that UPS and FedEx are often found in other countries. If they are willing to pay the shipping, that is fine, but I suspect that it would be high.

I still have not formulated the costs associated with copying the CD. I have to factor in the cost of the CD itself, packaging, postage, the cost of having it copied as well as the time associated with copying the CD, the time and effort to actually go to FedEx or UPS and actually sending it, any unpredictable costs. If I use ebay, there will also be costs in posting to ebay and using paypal too.

Perhaps you guys can suggest what these costs could come to and what may be a fair price...

Also, I want to give a little time for Holmes to either object or give his blessing to this idea, "or say nothing at all".

I am not familiar with spudster.org or tom hunt.

I am a student, so my funds are extremely limited. Any other ideas about distribution, web site, etc? I have seen some interesting web sites out there, I think one was atari.org, but I haven't been there in a while.

btw, is anyone able to help me in learning Assembly Language for the Atari computer? Any tips or ideas for the very new Assembly Language learner?

Heads up to all.

B&C has had some problems with their email servers since Dec 1st. If you made any inquiries or order requests since then, they probably didn't get the email.

Email addresses affected:
atari@myatari.com and sales@myatari.com

They ask me to get the word out that emails can be sent to myatari2@juno.com until they get the mail servers back up.

They're sorry if this has caused any inconvience to anyone trying to place an order.

You can visit their website at: http://www.myatari.com.

Glenn

<snippety>

Hi,

you might want to look up fair prices on http://www.tombstones.org.uk .

Although not Atari-related, this is a group of people from around the world
burning arcade ROM sets for the MAME emulator [1] at cost, making
no profit. I assume you could find out more about worldwide shipping
from them. Maybe it's even an idea to set up something alike for Atari fans
,
by Aatari fans ?

Just my 2 cents.

Kind regards,
Wef Dinaini

[1] MAME itself is worth a try, especially if you're also into Atari for the
nostalgia value.

Lacking a TV anymore, I route the output of my games/retrocomputers through a TV tuner card.

I couldn't find a suitable switchbox for my Atari 800XL the other day, but what I could find was this large "RF modulator switchbox thing" for a Texas Instruments 99/4A. This fit into the 800XL's monitor socket (DIN-5 connector). It's about the size of a deck of cards, has the TV/Computer switch, and an LED marked "protection" or something similar. I used that.

Bad idea. Let's just say I'm now $40 poorer and saddled with a TV tuner card I like less. The 800XL, OTOH, is still running, and the moment I did in the card, I found the appropriate switchbox.

Just a little warning if you're desperate one day.

This is well worth a read. Amy would have been a nice complement to Pokey!
Anyone fancy writing this chip into the atari800 emulator:-) ?

Thanks,

Mark

Well, without help from friends, no. My friend and myself played it almost 3 months day and night. It was a rewarding game, we loved to play it together and we did beat it! No hint books or stuff like that!

7092. TurboBASIC and decoding ATR's

Newsgroup: comp.sys.atari.8bit

Howdy folks

I've tried DiskFormer on the Atari and Imagic on the PC. No luck. So now I wanna try something different.

Is there a (fast) way in TurboBASIC for writing to a floppy directly? Reading the code from an ATR doesn't seem to be that hard, but how do I get this code on a sector. Most commands need a file name. And is it possible to write directly to boot sectors?

> these colors are not very pretty.

Don't forget that the C64 scene has come up with some nice graphics modes
too. We have HIP and RIP; they have IFLI.

> The ATARI has the advantage of a graphics mode like Graphics 9.This
> should be great for black/white movies.

HIP would be better.

> This is one advantage of the C64,on the ATARI certain graphics modes
> make it more difficult to play digis in good quality.

Why not use two Atari's. One decodes the graphics, the other decodes the
sound and feeds it into the audio line on the SIO connector of the computer
doing the graphics.

Andreas Magenheimer and Torsten Schall have put together a CD with all kinds of stuff that concerns Atari that where at one time shown on TV. Most of the stuff on the CD is probably in German, but they might have found some original English language stuff too. I'm sure Andreas will respond to you message within a week or so.

Hello, I just got done typing in the program (and checking it twice) ran it. It spit out 4 columns of 1's on the screen - I tried to move the trackball around several times and no change of the numbers...next I plugged in a working joystick, ran the proggy and moved the joystick around a bunch and still the 1's on the screen. I know this joystick works with a bunch of my carts. I don't have a mouse to test the program on.

any thoughts?

thanks!

I've used the TI/99 adapter before as well. I can verify that it does
produce a better reception on a TV as opposed to a normal switch box
(at least IMHO). as far as using a TV tuner card, shouldn't a
straight AV cable or a normal monitor cable have worked ?

Hallo Mathy,

I've written a small filter-driver for Sector I/O. You can use it from
any language that support XIO Commands.

Look at http://www.strotmann.de/twiki/bin/view/APG/CioFilterSio
for more information. If you need more functions, give me some
feedback on what you need.

Ciao

Carsten

Hi, Mathy;
I have not seen any languages that contain SIO commands for direct sector access, but all it takes is a few Pokes and a USR(ADR("hLYd")). Even easier in TB where you have DPokes. For all single density, use ("hLSd") and skip the direction byte in DCB. Lends itself to a subroutine or could be a structured USR(ADR(SIO$), SCTRNO, BUFAD, DRVNO, SCTSZ, CMND). ps the "d" is inverse.

Jindrich,
the reason Glen the 5200 man was able to convert the 5200 version of centipede to the 400/800 so easily is because the 5200 OS & the 400/800 OS are so similiar with subtle differences. May I suggest the Analog article that was previously posted that compares the 5200 with the 400/800. Think about it: Why would atari develop a whole new system when all they had to do was modify one that worked. The only thing that sucked about the 5200 was the quality of the hardware. You may want to post a copy of this article on your website for future reference?

TO THE
5200

by Claus Buchholz

When Atari designed the 5200 "Supersystem" as a successor to the aging 2600 VCS, they made use of the state-of-the-art hardware they put into their 400/800 home computers. As a result, the systems are quite similar. The differences are great enough, however, that transporting programs from one system to the other requires some effort.

The 5200 is a single-board machine with four controller jacks, a cartridge slot, an I/O expansion connector and a power/RF cable. It shares the same VLSI chips with the 400/800, except for the 6520 PIA (joystick/parallel I/O ports). The other chips (ANTIC, GTIA, POKEY and the 6502 CPU) are in the 5200, although some of their registers are in different memory locations than those in the 400/800. Also, some of the registers serve slightly different purposes. Figure 1 is a block diagram of the 5200. Let's look at each section of the hardware in turn.

When a specific register is mentioned in the article, the name is taken from the Hardware Manual in the 400/800 Technical Reference Notes. With the exceptions listed in this article, the Hardware Manual applies also to the 5200.

6502 CPU.

Although it is a standard 6502 from the programmer's view, Atari has reworked this chip to save four support chips. Those four chips mediate access of the system bus by the 6502B and ANTIC in the 400/800, but that function is built into the 6502C in the 5200. Atari also uses the 6502C in the new XL series of computers.

16K RAM.

The 5200 contains 16K bytes of RAM addressed from $0000 to $3FFF, just as in an unexpanded 400. The memory circuit is nearly identical to that in the 400, except it uses 4516s, a 5V-only version of the 4116 16K-bit dynamic RAM.

The 5200 monitor program reserves locations $0000 through $0018 and $0200 through $021B for shadows and RAM vectors. And, of course, page $01 is reserved for the 6502 stack. The rest of the RAM is available to the cartridge program.

ANTIC.

This is the same ANTIC chip used in the 400/800. Since ANTIC shares the address bus with the CPU and has no chip select input, its registers reside in the same place in the 5200's memory as in the 400/800's, page $D4.

The 5200 has no System Reset key, so bit 5 of NMIST is useless and the 5200's interrupt handler ignores it.

GTIA.

The GTIA and its registers perform the same functions in the 5200 and 400/800, except as noted below. The registers, however, reside at page $C0 in the 5200's memory, not at $D0 as in the 400/800.

The trigger inputs, TRIG0 through TRIG3, are wired to the controller ports, one to a port. The bottom button on either side of the leftmost controller zeroes the TRIG0 register when pressed, and likewise for the other ports.

The bits in CONSOL, the 400/800's console switch port (START, OPTION, SELECT and speaker), are used as outputs in the 5200, Bit 3, the 400/800's speaker control can still be toggled in the 5200 to produce sounds through the TV speaker. Bit 2 controls the pots in the joystick controllers. It must be set high to enable the pots.

Bits 1 and 0 select which controller port is to be active at one time. 00 selects port #1 (the leftmost), 01 selects #2, 10 selects #3, and 11 selects #4. The trigger buttons and pots are independent of this selection; it applies only to the keypads and top side buttons on the controllers.

POKEY.

POKEY's registers are all addressed at page ($E8 -not- $EB) in the 5200 as opposed to $D2 in the 400/800. Its functions are unchanged, however, except for two.

The eight pot inputs used for paddles in the 400/800 are wired to the 5200's controller ports, two to a port. Each controller has an analog joystick, using one pot to sense horizontal position and a second pot for vertical position.

The even pots (POT0-POT6) give the horizontal positions of range from 1 to 228; the maximum readings are to the right for the horizontal pot and at the bottom for the vertical pot. Figure 2 shows the pinout for the 5200 controllers.

Pin Function
1 Keypad -- right column
2 Keypad -- middle column
3 Keypad -- left column
4 Start, Pause, and Reset common
5 Keypad -- third row and Reset
6 Keypad -- second row and Pause
7 Keypad -- top row and Start
8 Keypad -- bottom row
9 Pot common
10 Horizontal pot (POT0, 2, 4, 6)
11 Vertical pot (POT1, 3, 5, 7)
12 5 volts DC
13 Bottom side buttons (TRIG0, 1, 2, 3)
14 Top side buttons
15 0 volts -- ground

The keyboard scanning lines in the 400/800 are used in the 5200 to read the keypad keys to the one controller that is selected by bits 1 and 0 in CONSOL. Only four lines are used, though, so only bits 1 through 4 of KBCODE are valid. Table 1 gives the keycode for each key on the controller. The top side buttons on the selected controller act like the 400/800 shift keys and also cause a BREAK-key interrupt, if that's enabled. Bit 0 of SKCTL, the debounce enable bit, need not be set in the 5200.

KBCODE
Key bits Keypad code
---
none 0000 $FF
0001 $0B
0 0010 $00
* 0011 $0A
Reset 0100 $0E
9 0101 $09
8 0110 $08
7 0111 $07
Pause 1000 $0D
6 1001 $06
5 1010 $05
4 1011 $04
Start 1100 $0C
3 1101 $03
2 1110 $02
1 1111 $01

POKEY's serial I/O lines are used in the 5200, but they are wired to the I/O expansion connector, an edge connector hidden behind a small door in the rear of the 5200. This connector allows for more hardware registers addressed at page $E0, and for peripherals using the serial port. See Figure 3 for the pinout of this connector. Its existence demonstrates Atari's original plans to expand the 5200 system.

ROM.

The 5200 has a 2K ROM on board which holds the character set and monitor program. The character set, which is an exact copy of the 400/800's set, resides at pages $F8 through $FB, and the monitor sits at $FC through $FF.

The cartridge ROM can be 32K bytes long and resides in memory from $4000 to $BFFF. Figure 4 shows the pinout of the cartridge slot. The two interlock connectors are wired together on a cartridge board. The 5200 uses this as a switch for the cartridge's power connections and as a Reset signal. Therefore, a cartridge may be safely removed or inserted while the 5200 is powered on.

The 5200 monitor program.

The 1K monitor program in ROM has three functions: (1) to initialize the system before running the cartridge program, (2) to service interrupts as they occur, and (3) to maintain shadows of some important hardware registers. Recall that the 400/800 Operating System is 10K bytes long and performs the above functions. It also provides peripheral handlers, predefined graphics modes, a screen editor, and floating point math routines. Those utilities do not exist in the 5200.

Table 2 shows the RAM locations used by the monitor for shadows and RAM vectors.

Table 2. 5200 Monitor RAM Locations.

Page Zero Locations
$00 Shadow for IRQEN
$01 Real time clock (high byte)
$02 Real time clock (low byte)
$03 Critical code flag (if non-zero, VBI routine is abbreviated)
$04 Attract mode timer/flag
$05 Shadow for DLISTL
$06 Shadow for DLISTH
$07 Shadow for DMACTL
$08-$10 Shadows for COLPMO through COLBK
$11-$18 Shadows for POT0 through POT7

Page Two Vectors
$200 Immediate IRQ vector
$202 Immediate VBI vector
$204 Deferred VBI vector
$206 DLI vector
$208 Keyboard IRQ vector
$20A Keypad routine continuation vector
$20C BREAK key IRQ vector
$20E BRK instruction IRQ vector
$210 Serial Input Data Ready IRQ vector

$212 Serial Output Data Needed IRQ vector
$214 Serial Output Finished IRQ vector
$216 POKEY Timer 1 IRQ vector
$218 POKEY Timer 2 IRQ vector
$21A POKEY Timer 4 IRQ vector

Upon Reset, the 6502 vectors through $FFFC to the initialization routine. This routine performs the following sequence.

1. Disable maskable interrupts, clear the 6502 decimal flag, and set the stack pointed to $01FF.

2. If the cartridge address $BFFD contains $FF, then jump immediately through the vector at $BFFE (diagnostic cartridge).

3. Zero all hardware registers and page $00, set CHBASE to point to the character set at $F8, and initialize the first six RAM vectors starting at $0200.

4. Set up the Atari logo rainbow display. The cartridge title (20 characters) and copyright year (2 characters) in ANTIC mode 7 display code are taken from cartridge addresses $BFE8 through $BFFD.

5. Enable VBI (Vertical Blank Interrupt) and DLI (Display List Interrupt), and enable key scan.

6. Wait four seconds, then jump through the vector at $BFFE to the cartridge program.

When the 6502 receives a non-maskable interrupt (NMI), it vectors through $FFFA to the NMI handler. The following steps take place:

1. Check NMIST and strobe NMIRES to reset the interrupt status.

2. If a DLI is pending, jump through the DLI vector (initialized to point to the rainbow effect routine).

3. If a VBI is pending, jump through the immediate VBI vector (initialized to point to the VBI routine).

4. Else, return from the interrupt (no System Reset).

A cartridge program can change these vectors to point to its own DLI and VBI routines, if it must. The default VBI routine takes the following action.

1. Push A, X, and Y onto stack, increment the real time clock, and update the attract mode timer.

2. If the critical code flag byte is non-zero, then pop Y, X, and A from the stack and return from the interrupt.

3. Update DLISTL, DLISTH, and DMACTL from their shadows.

4. Maintain the attract mode flag and update the GTIA color registers from their shadows.

5. Update the pot shadows from POT0 through POT7, and strobe POTGO to start another pot scan.

6. Jump through the deferred VBI vector (initialized to point to the end-of-interrupt routine, which pops Y, X, and A, and returns from the interrupt).

If maskable interrupts (IRQs) are enabled and one is received, the 6502 vectors through $FFFE to an instruction which jumps through the immediate IRQ vector. That vector is initialized to point to the IRQ routine, which performs the following tasks.

1. Push A and check IRQST.

2. For each of the eight bits in IRQST, check for a pending interrupt. If found, then clear the status bit, update IRQEN from its shadow, and jump through the appropriate IRQ vector.

3. If no interrupt found, then push X and check for a BRK instruction interrupt. If found, then jump through the BRK instruction IRQ vector.

4. Else, pop X and A and return from the interrupt.

The only IRQ vector that is initialized is the keyboard IRQ vector, which points to the keypad read routine. That routine does the following:

1. Push X and Y.

2. Read KBCODE and mask bits 1 through 4.

3. Convert to the keypad code given in Table 1, leaving that code in A.

4. Jump through the keypad routine continuation vector (initialized to point to the end-of-interrupt routine).

Comparing the 5200's monitor vectors to the 400/800's OS vectors, we see that Atari paid no attention to compatibility between the two. This further complicates the task of converting a program from one system to the other.

Transportability.

It would not be difficult, given the information in this article, to write a program in two versions, one for the

400/800 and another for the 5200. Nor would it be difficult, given the source code, to convert a finished program from the 5200 to the 400/800. The reverse is more difficult if the program takes advantage of special features in the 400/800 OS. Otherwise, the only task, aside from redefining some addresses, is to convert the keyboard/joystick input routines from one system to the other.

I acquired the information in this article by dissecting a 5200 and disassembling its ROM. The 400/800 schematics in the Hardware Manual were quite helpful. It is interesting to note the difference between the two machines and to guess Atari's motives for the design differences. But the similarities grossly outweigh the differences, so that a 5200 program can be developed and almost entirely debugged before testing on a 5200. With the addition of an EPROM burner, a 400/800 can be a powerful development system for 5200 programs. An adventuresome hacker can even bypass the EPROM by putting dual-port RAM on the cartridge board and downloading programs from the 400/800 development system into the 5200 for testing.

A.N.A.L.O.G. #16, February 1984

READER COMMENT

5200 Article Update. (ANALOG #15)

Newer releases of the 5200 incorporate some minor hardware changes. Controller ports 3 and 4 have been eliminated, making POT4 through POT7, TRIG2, TRIG3, and bit 1 of CONSOL useless. A few of the connector pins have been redefined. Pin 2 of the I/O expansion connector now carries POKEY's Audio Out signal. Three pins on the cartridge connector have changed to accomodate the new 2600 adapter. The system clock, 02, is output on pin 14, isolated through a diode. An alternate video input is taken from pin 24 and is also isolated through a diode. Pin 30 provides an alternate audio input.

There is space on the newer boards for circuitry for a PAL (European TV standard) version of the 5200. Also, on power-up, the monitor program checks for the PAL version by examining the GTIA register PAL after step 2 of the initialization routine. It also checks the cartridge program for PAL compatibility. The byte at $BFE7 should read $02 if compatible, or $00 if not. This is the only important change to the monitor program. There are some additional hardware changes, but none affects the machine's operation from the programmer's view.

Hi Mathy;
Just checked the link for Carsten's utility and it appears the read and
write sector portions are not yet functional, but he does offer to custom
write what you need.

I still like 8 Pokes and USR(ADR("hLYd") or in TB, 2 Pokes and 3 DPokes.

My Axlon came used with no docs...

Which is the Reset line? I would not recognize it if it jumped up and bit me somewhere.

Hello All,

Just started a new eBay auction for Macro Assembler (complete and boxed).
The link is:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=805345756

Be sure to click to see my other auctions. I've still got a copy of Page 6
magazine issue 2 (*RARE*) up for grabs!

Well, in my case, it let the magic smoke out!

> as far as using a TV tuner card, shouldn't a
>straight AV cable or a normal monitor cable have worked ?

Not that I could see.. the card has the ~1cm diameter plug with the tiny hole for an antenna input, and a RCA jack for 'composite 1' input. The 800XL has an RCA output, and the monitor output. I tried just directly connecting the RCA jacks, but got nothing (probably converted too far to a TV signal for it to take as composite). I also tried the switch box from a NES. The only other thing I had that fit into the monitor output would be the RF modulator (on its last legs) from a Commodore VIC 20, and we all know how well Atari and Commodore get along :)

>(mine included). I'd love to see more people enjoy the items.

I dnled the whole thing one day at work. :)

I think I may have something that isn't on the list too. I have a cheat version of Alternate Reality, The City. All stats are highest level and rotate around and around at that level until you press a key to create your character.

I should try to make an image of it somehow and upload somewhere. I'm sure someone else has it though...

Hey, the best part about that game was the EXTREME difficulty in advancing when you first start it out. I spent months on it, dying time and time and time and time again before I finally figured it out "save the game EVERY SINGLE TIME you advance, even in the SLIGHTEST DEGREE and make several copies of it". Eventually, I had a VERY high level character.

And speaking of AR - has someone here ever seen the magic crystal armour ?

A friend of mine who played this game virtually day and night eventually had
a character wearing this. *Poof* instant invulnerability!

Shame I never got around to converting it to ATR, and I haven't seen the
guy in years...

Source record: 25002

It is a very simple thing to use a PC "Clone" power supply to power any atari XL or XE computer (with the notable exception of the 1200XL and possible the 1400's as well).

The Atari XL/XE machines use 5volts DC at 1 to 1.5 amps (depending on model and how hopped up they are in terms of memory upgrades and whatnot).

I haven't plugged my XE's into an atari-provided powerpack in something approaching a decade.

Just strip the wires off the power pack and wrap/solder/wirecap them onto a clone supply's 5volt and ground lines.

I use the part of the clone's outputs normaly meant to power the clone's motherboard. It is not often, but sometimes that the clone powersupply requires a greater load than an XL or XE in order to begin supplying voltage to the XE. In this case, take a spare clunky hard disk and hang it off the clone supply. You now have a powerpack that will run as many as 20 but I'd reccomend no more than 10 XL/XE computers for the cost of nothing but a switching power supply you thought you had no need for.

Note, most clone power supplies are discarded not because they don't work, but because thier fans failed or were loud. If you only hook the XE and a drive up to one, convection will provide all cooling the power supply needs which obviates the need for it's fan.

Regards,

Jeff

Anybody have or know of a good copy of this game?? I have tons of copies, but they are all the same. It was a bad copy because it has a line that runs through the screens that doesn't go away. I don't have access to my Atari right now and I don't have SIO2PC, etc, to transfer my copy to the PC. I cracked mine. It was fairly easy. If I remember right, it looked for a bad/unformatted sector. I found the reference to this sector and zeroed it out and viola! After that, no more "knocking" and it was copyable too.

Happy 8-bitting!

I played and played and played and played that game and never got that armor. I didn't even get the magical flame sword. A relative of mine played my character without my permission one day and when I got the disks make, he had found it himself. Oddly enough, I was a God in the city and then I transferred it to the dungeon. Whole new ball game. I was a pitch black evil tyrant (only way to survive in the city) and my magical flame sword was not as good in the dungeon as it was in the city.

Eventually, I joined the guild of Chaos and dumped all my valuables in the locker. I then went to the dungeon church and dumped all my valuables outside the church, went in and repented. When I came out, I was "neutral" again, and all I had to my name was sack cloth and ashes. I picked up the stuff outside the church (the stuff that had not been stolen already) and went to the guild. So long as you have NO encounters from the church to the guild, you will be able to pull all your stuff out of the locker. The guild will be PISSED OFF at you, and tell you so too, but they should allow you to get your stuff before you resign your membership. I had to try that twice because the first time I met with a pauper, and since I didn't attack him or anything the guild didn't even give me a change, they just kicked me out and I was out all of my valuables. Eventually I was a good little boy. If you are "good" enough, you can even sleep at the church as long as you like (as opposed to the 12 hour maximum at the retreat), eat at the church, and they give you a gift too for being so good. All for free.

To those that did not know, do not sell your gems and jewels in the dungeon. You will need them much later on in the game when you start exploring the second level and visit the dwarven smithy. The equivalent to the magical flame sword in the dungeon is pretty much a sword made by the dwarven smithy, but he wants something like 150 gems/jewels for it. The crystal plate armor in the crystal caverns is good too, just make sure you know where the fountain on the second level is before getting it, you may need it.

For those interested, I have an SIO2PC cable and am capable of putting any image on a regular diskette or vice versa.

FWIW: Had the same problem with "Your soul is black as pitch!" My son would run my city character before I got home from work and mostly ruined him for The Dungeon. I did finish The Dungeon with him, but it was really a long road.

After I had played The Dungeon a lot I got familiar with most of the areas. I went back and started another City character with good alignment and things worked out much better. I forgot the level you needed to be before you could use The City to The Dungeon transfer, something like 7+ so it really wasn't that bad. As I recall I could get the HP apple, the weapon Katana Ice, the spell Temporal Fuge<?>, and get into The Santuary w/o having to kill anything.

There were also some good combinations to use that I can't quite remember accurately now. Something like keys or objects that would heal you or call 8 brigands if you got the wrong type. All you needed was a fire horn which damaged all of your opponets before you tested them out.

All in all it was a relative breeze<compared to evil> going through with a good character.

I did, but I do remember it took me quite a long time to make it
through that last dungeon.

> How long did it take you and what did you find most interesting about the
> game?

I honestly can't remember it has been so long, but what I liked
most was the character interaction, and stealing from the blind
vendors. ;)

That '1cm/tiny hole' jack is a 75 ohm F-type coaxial cable TV connector; the
RCA out of the 800XL has this same signal and needs only a matching plug or
a RS adapter.

The Monitor out of the 800XL includes a composite and ground for connecting
to the RCA composite jack of the card.

> > the Amiga's schematics("borrowed" from Amiga Company before Commodore
bought
> > them.

Er not quite. Amiga were developing a 16bit for Atari before Commodore swooped in and gobbled them up (the development led to the Amiga). Atari then managed to develop the ST from scratch in about a year. Hence the off the shelf chips and operating system (good job though). Atari later clobbered Commodore in a lawsuit about the aforementioned matter.

7150. RAM Test Atari 600XL ????

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-11 23:56:32 UTC
From: retroman@bluemail.ch
Message-ID: <55a0ae1e.0212111556.290c346f@posting.google.com>
Source record: 25020

Hi there :-)

First of all, I have to admit that I never owned an 8-bit Atari Computer before ;-) I was given a 600XL from a friend of mine for free but Iï¿½ve got nothing with it, no PSU, no Floppy/Tape Drive or anything ! Since I am also a collector of old Hardware, I took it and began to search the web for information !

First of all, Iï¿½ve made myself a Power Supply, which was an easy task ! Now I looked into Data Transfering between PC and 600XL and found the SIO2PC Interface, but before I wanted to upgrade my 600XL to 64KB (cause I want to play M.U.L.E and other nice old games :-D) ....

So I made the Upgrade (see : http://trident.mcs.kent.edu/~clisowsk/8bit/600xl64Kb.html) !!! Seemed to work fine, BUT I cannot access the RAM Test anymore with pressed OPTION Key and a reset ?!?!? So I turned it off for about 5 minutes and tried again and it worked, but it only shows up with 48KB (3 rows) in Mem Test ! I thought Iï¿½ve upgraded to 64KB ? Is the other Ram not working ?

Btw. I never got the RAM Test working again after a reset (worked fine with 16KB), could the Ram Chips be too fast (100 ns) ??? I only can access it when turning of the machine for 1 or 2 minutes !!!

TIA ..... RetroMan (a proud 600XL Owner :-D !!!!!!!)

This is all normal. The built in RAM test will not test the RAM under the OS
so you never get 64k.

The newer RAM chips have longer data retention times so you have to leave it
off longer.

My guess is to check and recheck your soldering (meaning did you run the wires to the correct pins/pads?).

It sounds like the bit that is used to toggle the ram 'under the os' isn't connected. It might even be connected to the bit that is used to turn on the diagnostic rom....?

Regards,

Jeff

I do not remember too much difference with the evil and the good. Some things I did notice was that if you are too evil, the thieves guild will not let you in. If you steal from the bank vaults, the guards are always hounding you, the spells are different and a bit similar, the manual says that some goods spells are more powerful than the evil spells but I did not notice that, I got a kick out of using a scepter of chaos, I used the ring of the trolls/goblins for a while (prevents hunger, makes you more evil), was friends with the goblins for a while (before I took their ring) and it was interesting to "hail" them and watch them leave. All things you can do as an evil tyrant.

But, like I said... I was not evil for long. I wanted to play a good character and the dungeon allowed that to happen easier. In the city, if you are good, even the good characters steal from you when you try to disengage. It got rather tiresome to lose so many valuable things that I just decided to kill anything and everything. Besides, I thought it fascinating, a good challenge, and fun to give up my worldly possession at the church and repent to go from evil to neutral in just one round.

Only thing is that it takes forever to become good enough for the guild of light...

Message-ID: <E9YJ9.46876$jf7.2820270@news2.west.cox.net>
Source record: 25026

I am wondering if there is a utility that would make it easy to copy files from an ftp to your computer by comparing the file sizes and if they are the same it goes to the next, if they are different, it asks you to overwrite or allows you to save it to a different directory? I don't want it to overwrite the older files but I want to save the newer ones to a different place.

Thanks

Happy 8-bitting!

Nite Hacker

PS Also that it would either overwrite or write the different files into a new directory without confirming each file (unattended copy mode, sort of).

Hello

Who is using this Polish Emulator? It took some time to understand the
polish settings, but now it's working.

It is definately NOT a bad emulator!!! The graphics emulation looks better
to me, than the common emulator atari800/atari800winplus

7161. atari++ linux emulator ready

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-12 11:11:21 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <at9qsp$5vr$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 25032

Hi folks,

a new Atari emulator for Linux is ready for launch-off.

Features of atari++:

- precise sound and graphics emulation for the atari800,XL and XE series
- includes undocumented features like GTIA priorities, color fiddling,
configurable p/m graphics collisions
- ANTIC scrolling bugs
- 6502 bugs/extended instructions, precise timing of the DLIs including
DMA cycle stealing.
- POKEY "high pass filters", including "Software Speech" generation
- generation of screen snapshots and audio snapshots (as .wav)
- disk drive emulation for .xfd and .atr files and built-in loader support
for executables (.EXE and .COM).
- printer support
- joystick support thru analog joysticks, mice, keyboard, or digital (atari)
joysticks by a simple home-made interface.
- host file system access
- very configurable by build-in user menu
- provides an X11 output and - if availabe - SDL graphics output
- generates sound thru the OSS sound drivers or alternatively generates a .wav
file.

and finally, for all the programmers amongst us,

- comes with documented source code and manual
- and has a clear object oriented design in C++.
- configures itself thanks to "autoconf"

The got tested fine under Linux (Debian, Suse,...), Solaris and IRIX. It
should work on a lot more "unixoid" systems.

If you're interested, I'll hand out a tar-ball of the sources, ready
for compilation, please drop me a mail at thor@math.tu-berlin.de.
You'd just need to run "configure", then "make", there's no
hassle to compile it.

So long,
Thomas

Howdy folks

Anybody have the pin outs on the Axlon memory boards?

We're trying to determine if these boards used the Reset line.

If you change STICK(1) to STICK(0) you can test the other joystick port.

BTW did you test both joystick ports with the game you wanted to use the
trackball with?

Hello

Who is using this Polish Emulator? It took some time to understand the
polish settings, but now it's working.

It is definately NOT a bad emulator!!! The graphics emulation looks better
to me, than the common emulator atari800/atari800winplus

It sounds as if you are looking for a download manager. There are many, and most have lots of features. I like "GetRight", and I also like "Cute FTP". You can find these (and other shareware/freeware managers) at www.download.com
You will have to sort through what features you really want.

Argh! Not if you believe David Haynie (designer of the 3000, amongst other things) in a recent comp.sys.amiga.hardware thread. But I'm not going to regurgitate that - it's far too dull. Search for it in Google Groups if you're really interested.

Well,
my friend Walter Lauer also misses the 5200 Space Invaders on his XL/XE
computer. He loves the 5200 version, because after a while a new font
gets loaded and thus new/different shaped invaders appear. the 5200
kangaroo also didn`t make it to the XL/XE, there is only the Atari 800
prototype cart (works only with Old-OS). And Tempest - well I guess it
is missing on the 5200 as well as on the XL/XE... -Andreas.

Oops,
it is just the other way around: most of the stuff on these two CD`s is
in english language. we could not find the german Atari adverts
anywhere. Only one thing is really bad: there is an interview with Nolan
Bushnell and everytime he starts saying somethin, a german translator
tells you everything in german language (so you cannot hear Nolans
original speech anymore)... Anyway, I am still searching for any kinds
of Atari related films, movies, adverts, etc. so we can further update
these CD`s.

By the way: Does anybody know where to find the original music-video of
"Money for Nothing" (by Dire Straits), made with Degas or Degas Elite
(or at least with the help of an atari St) ?!?
greetings, Andreas.

> - 6502 bugs/extended instructions,
I saw the description of these in Tomo's "Complete and Essential Map".
However they don't seem of much interest. That said I've seen demos that
claim to use them to do effects faster. Which ones are useful and how?

> DMA cycle stealing.
Interesting you worked out the precise timing for this. I only saw very
poor documentation in Atari's Hardware Manual (about 3 lines!). Did you get
a logic analyser onto it?

> - joystick support thru analog joysticks, mice, keyboard, or digital
> (atari)
So you can use real joysticks -> cool!

> - provides an X11 output and - if availabe - SDL graphics output
Why use X directly at all? Why not just use X11? I know supporting systems
without SDL, but SDL is meant to be portable...

> - generates sound thru the OSS sound drivers or alternatively generates a
How about SDL sound? Then it will automatically use Alsa, Arts or even
Windows or BeOS sound systems.

> - comes with documented source code and manual
You're kidding?

> - and has a clear object oriented design in C++.
Got some pretty class diagrams for it? :-)

7183. Atari 400/800 emulators for PC - getting them to work?

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-12 23:53:26 UTC
From: Stellijer <howapropos@hotmail.nospam.com>
Message-ID: <3i9K9.29375$X%3.28300@news.bellsouth.net>
Source record: 25054

I've heard some things about Atari emulators for the PC. However - I've not known which ones are real, which are bogus... and have not known anyone to actually get one to work.

I'm interested in learning how to make an Atari emulator work on the PC. Has anyone gotten one to work? Which one? How well did it work?

Also... can you load Atari disks into the PC by some method?

Any info appreciated.

> work?

I've used PC Xformer and XL_It! for a couple of years, and they've worked fairly well, but then I discovered Atari800Win (http://www.a800win.atari-area.prv.pl/). It works Great!! It is the only one I use now. It emulates the 400/800, XL, and XE series. It emulates various RAM upgrades for the XL and XE systems, up to 1088K on the XE. The current version, verified 12 Dec., is Atari800Win PLus 3.1 (which I have; no problems yet; I've been using it for a few months now).

There others I haven't mentioned, for Linux, Mac, Windows, and (I think) other platforms, but I have not tried any others for Windows. If you're interested, do a Google search for "+atari +8-bit +emulator" (no quotes). Google reported "about 18,000" matches.

> Also... can you load Atari disks into the PC by some method?

Nick Kennedy developed the SIO2PC hardware and software package to permit the PC to act as the "floppy" drive for the Atari 8-bit. I built one, and it works beautifully. The software (SIO v4.19) is easy to use (for me, at least). See http://www.tcainternet.com/wa5bdu/sio2pc.htm for details.

The 1050-2-PC is an interface almost identical to SIO2PC that allows the same SIO2PC software to access a 1050 floppy drive in the same manner an actual Atari does. I built one of these also, and have had _ZERO_ problems accessing the 1050 dedicated to converting floppies to ATR's. (I still have an XF551 connected to my 130XE, though; sometimes its faster to use the actual floppy.) 1050-2-PC details are also on the SIO2PC page.

> Any info appreciated.

You're Welcome!

RoyalHeart

Overworked and underpaid. I'll help others when I have the
time...and can afford it.

That is about it. Even the old 8 bit ones like Thompson cost ~$160 when you could find them.

The rock bottom lowest price I have ever seen was $50 for a returned and tested good JDR one in their show room years ago. I think it was limited to 32 pins and DOS based ISA machines. Figure the ZIF socket alone cost about $13.

I would first expect that the Home Bank is always the current bank when the
ramdisk is not actually being used. This is so the program underneath will
work.

Now a user changing the banks themselves is another matter and must also make
sure to select home bank when not using the extra ram banks. Reset must set
this same value, or again the program underneath would not run and the computer
would lock up.

I can't find anything obvious about it in the manual.

I have fixed a dozen or so Induses where the 9VAC supply was plugged in. Th drive died, not the power supply. Usually one or both regulators went. Replacing the dead one(s) fixed the drive.

The extra volts over 9 is required to make the regulator, etc work. Two to four volts is o.k. As a safeguard, I added a large rectifier diode(1N5401) to the power input jack center pin.

Vendors have no place else to post. I don't mind the posts, unless
there are a dozen a week, practically identical.
I like knowing about new things they have(done).

Bandwith isn't a problem...I just select the headers of the posts I want
and get them. I suppose others have to get all, don't know of a
solution for them.

I prefer the Not Moderated option myself.

Holding option without a drive attached will take you to the tests when
you boot the computer. So will BYE from BASIC.

You will only ever have 48K of user ram...the O.S. and hardware chips use
the other 16K, which is accessable from DOS2.5 and other sources.

The machine was designed to fast cycle with only 16K, 64K will take longer
without a reset circuit.

Sounds just like a rana. I have one THAT ACTUALLY WORKS!!!! Most of them were stillborn which prompted the formation of Indus and the redesign of the drive to include a track zero sensor. It didn't help, but it looked good on paper. Every Rana I've run across but one I've had to realign. Didn't help them much in terms of reliability but did return them to serviceability til' they dealigned themselves again.

Everything aside peripheralwise, Atari made the most reliable, sturdy, dependable drives for the Atari. No other maker even came close. I've tried them all. The only drive controller that is nearly as reliable is Bob Puff's 'Black Box Floppy Controller'. His is is near bulletproof as they come short of an actual 1050 - maybe better.

Failures I can attest to are: Rana 1000, Indus GT, Percom AT series, ATR8000 series. Despite thier cool features, as disk controllers they suck. The CSS BB/FB is the only decent replacement I've run across. Pricewise it is a littel steep, but it really WORKS and works and works. Not something you can say about anything short of the 'real deal'.

Regards,

Jeff

From: Technoid Mutant <technoid@nospam.30below.nospam.com>
Message-ID: <uhhK9.3121$i83.1207@news.bellsouth.net>
Source record: 25072

I know it is a sin, but most of you aren't handy with a soldering iron. God forgives you.

I make this offer:

If you will guarantee shipping in BOTH DIRECTIONS, I will upgrade your Atari's memory, pokey, etc for free (in terms of labor). You are responsible for all parts. I would much prefer it if you contacted me prior to shipping with your requirments so that I can give you a list of the parts required for you to provide with the machine. Barring that I'll source the parts myself but what you will experience is a significant delay in the upgrade process and delivery of your upgraded machine.

I will not be available to provide this service from the 23rd of December 2002 through the 6th of January 2003. Please take this into account when you make your order.

Notes:

Wire is not needed or asked for as regards these upgrades. I have enough high-quality wire to last a lifetime.

Circuit boards are allways nice. If you love me, include a little circuit board (12cm X 12cm give or take) with your shipment even if it isn't required for your upgrade.

If you need anything specific (such as a 1200xl mod for power to the sio port). Please include this as a requirment in your email.

Finally, my email is TECHNOID@30below.com

If you wonder why I'm not including a shipping address, it is to foil the idiots who would just drop thier machiines it the mail with no explanation whatsoever. This way I have some limited control on what is got and what I need do.

I'm a qualified technician of 22 years experience. Your prize Atari is safe in my hands.

Again, I do this as a service to the Atari Community. No more. Any faults are your own to own. I claim no and will accept no liability. These machines are old as dirt to begin with and it is rude to assuume I am imperfect if it is faulty.

Given the above caveat, your machine will function as perfectly as I can make it and as reliably as any Atari computer. That is a nice thing to hear. Atari computers are astonishingly reliable. I have loved them, will love them and will keep on loving them.

Best regards,

Jeffrey S. Worley

I should note that this offer is inclusive of:

The construction of SIO2PC interfaces, Rverter-type interfaces, or any and all of the modifications or projects available for the Atari as long as parts are included.

I should also mention that fine-quality solder is a nice thing to have. I would appreciate the inclusion of a fine quality solder in your order. I've been using Radio Shack Archer model 64-013 solder which is 2% silver and of very small diameter. Inclusion of a reel of similar solder would be greatly appreciated. Don't over do it though. A reel goes a very long way.

soon.
> > His daily business keeps him pretty occupied.

I checked. The files you mention are on there, but not the source code to FMTDIR. That's what I meant. The source code of HDFMT and PARK and DISKCOMM and probably a few other things too is up their, but not FMTDIR as far as I could see. Marius was talking about modifying FMTDIR. I guess I needs the source code for that. He might try disassembling it, but that's a pain in the ..... and Bob Puff might not like that. But he can always ask Bob for the source code. But he'll have to be patient.

Howdy folks

I seem to have bumped into two problems.

a) I have responded to messages, but two of them I can not see. Andreas responded to one of them, so I guess the problem is on my side.
b) The mail delivery subsystem keeps telling me it can not find c.s.atari.8bit and can therefor not post my messages to the group. This problem started sometime after I wrote the messages mentioned above. But guess what? These messages DO show up in c.s.a.8.

Anybody have a clue what's going wrong here?

Source record: 25077

Howdy Larry, Ron, Carsten, folks

Since Carsten's stuff isn't ready to be used and Ron's stuff only does Enhanced density, I tried the stuff Larry sent me.

I first loaded it into TurboBASIC but when I saw something that didn't look like it belonged to TB, I remembered that Guus Assmann had specially made me a cart that holds both Mac65 and BASIC XE. So I tried the latter (works great with MyDOS 4.55 beta 2's MEM.SAV feature).

After changing two lines (REMming one and removing the REM from another and renaming one variable (ATRNAME$ to FILENAME$) ATREXAM.BXL works. I'll probably change some of the upper case characters to lower case, but i's a nice utility.

Then I tried ATR130K.BAS works great, but I forgot that 130k means enhanced density.
So I tried ATR180K.BAS in the hope that it would work with DSDD disks.
Well, I got an error 33 in line 410. 410 looks like this: "410 del"
I looked up error 33 in my photocopy of the manual and it's not mentioned. 32 and 34 exist, but 33 is not in the list. I changed it to ELSE and later ENDIF, but bumped into problems later.

Larry, could you tell me if there is an error in this file?

BTW I hope to improve this fine piece of software. Plans are to either incorporate all of them in one file or to have ATREXAM load the appropriate file. Even the 'disk should be in D/D' could be knocked out if I find out how to set the disk to DD before hand.

That's it for now.

7207. Re: RAM Test Atari 600XL ????

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-13 11:06:23 UTC
From: Nite Hacker <nitehacker@hotmail.com>
Message-ID: <PajK9.52691$jf7.3289378@news2.west.cox.net>
Source record: 25078

I think the question has been answered but here is a layman's point of view...

There are a couple of ways to access the Self Test mode.

1) Turn off all drives connected to the computer and turn the computer off too and then hold option while turning the computer back on.

2) This is the same as 1) except if you don't hold down Option and you are at the blue screen with ready prompt, then type DOS and it should take you there.

3) This is the easiest one of all... don't matter if drives are on or not... just type BYE at any time. The only thing is once you do this, you cannot go back to BASIC, etc. You have to reboot the machine again.

As mentioned already, even though a machine is 64k, you get only 48k because the OS chips (OS, Antic, Pokey, etc) which is the main OS (8k) and BASIC (8k) hides the first 16k. You can, I think, however, free up 4k more of memory for your programs by doing a few pokes, but it is only useable for data storage and ml, not for BASIC code. I am not a programmer so I don't know how this is done but I have seen this mentioned alot. Anyways, the first two big bars in the Self Test mode is the OS chips being tested. I guess that the first bar is the OS and the second bar is BASIC? The rest is your RAM in 1k increments. I don't know how, or if you can really, interpret the 1k blocks to trace down faulty ram chips or even the OS chips for that matter. Self Test is just a vary basic diagnostic tool.

No matter how much memory is added, ie 256k, etc, only the OS and the main memory area (48k) can be tested. These machines were built when I don't think anyone had the clue that it was possible to add on more memory beyond the 48k. I guess the possibilities opened up when the XL/XE line of computers came out and there was a free port available for a number of applications due to the elimination of joysticks 3 and 4... but I don't think Atari ever envisioned one having 1meg or 4megs of memory or having a double Pokey, etc! These machines were more versatile than even Atari themselves probably even knew about them.

I guess it depends on the upgrade, but most upgrades where designed in the same manner so you have to subtract 64k (the OS and memory) to get the useable memory, ie 256k becomes 192k, etc. That's what I was told when I got my 256k upgrade years ago. I guess there might be an upgrade or two now that gets around this problem. I don't know about them since I haven't been around in awhile.

Lastly, I don't think the speed of the chips should be a problem. Faster chips are fine, however, that doesn't make your computer run faster because

the timing and the speed of the computer is still the same. However, slower chips would be a problem causing erratic behaviors, etc. So you need to make sure you don't go below the rated speed. I don't remember what it was... 50ns, 60ns? The speed rating means that is the max that it can run at. They are not set at a fixed speed so they can run at any speed up to the max rating.

Anyways, I hope this helps...

Happy 8-bitting!

7208. BASIC XE source code????

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-13 11:09:21 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <atcf52$c6q$1@nets3.rz.RWTH-Aachen.DE>
Source record: 25079

Howdy folks

Does anybody have the source code to BASIC XE???

I discovered that it doesn't work with my memory upgrade, which means it probably doesn't work with modified Newell 1MB upgrades either. (these modified Newells use an AND gate - or was that a NAND - to enable you to use BASIC without resorting to the use of switches.) The mod could be real simple, but we need the source code to check how it handles extended RAM.

7209. Re: atari++ linux emulator ready

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-13 12:05:48 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <atcies$9q1$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 25080

Hi Mark,

>> - includes undocumented features like GTIA priorities,
> What are these?

For example, priority zero where p/m zero/one color has to be or'd with
playfield 0/1 to get the right color, or what happens in case of conflicting
priorities. These include all cases where more than a single bit or no bit
is set in GRIOR

>> color fiddling,
> And these?

Includes the kind of colors you get when you overlay a player to antic2/3/F
(graphics 0,graphics 8) output. In this case, the hue of COLPF1 is taken from
the overlaying player and no longer from COLPF2 as one should expect.
Especially, collision registers work strange in these modes. A collision with
the COLPF2 background is not noticed, and a collision with COLPF1 graphics on
top is registered as COLPF2 collision. Also includes the color artefacting
that has been used to emulate colors in these "hi-res" modes on NTSC, i.e.
"artefacting".

>> - ANTIC scrolling bugs
> And these?

The sort of things you get if you enlarge VSCROLL over the amount of
scan-lines per mode line. Nasty. I don't know whether these have been
used anywhere, but I'm picky here. (-;

>> - 6502 bugs/extended instructions,
> I saw the description of these in Tomo's "Complete and Essential Map".
> However they don't seem of much interest. That said I've seen demos that
> claim to use them to do effects faster. Which ones are useful and how?

I've seen some software protections which use parts of these instructions
for "obfuscination", specifically "Blue Max".
"David's Midnight Magic" depends on some 6502 bugs, especially on the
bug of LDA (ea,X) to wrap-around to page zero if the indirection address
plus X is larger than $ff. Some software depends on the way how the
decimal flag reacts on improper (non-BCD) input that should be emulated
precisely by the cpu emulation core.

>> DMA cycle stealing.
> Interesting you worked out the precise timing for this. I only saw very
> poor documentation in Atari's Hardware Manual (about 3 lines!). Did you get
> a logic analyser onto it?

Unfortunately, no. A lot of testing and reasoning, i.e. how many data bytes it has to read, and how. I also made a couple of tests on my Atari like "run a routine that just toggles a color on and off, and see how large the stripes get". The results are very complicated, and I tried to follow these rules as close as possible. It is not 100% accurate, but something like 95% acurate. Antic seems to steal cycles in several "slots" starting at the horizontal blank position and advancing along the line. If enough data has been fetched, the slot is "closed". Hence, it doesn't steal cycles continuously and equally distributed along a line, but steals more to the left than to the right. This is very messy, and I could only emulate this to a certain degree.

>> - joystick support thru analog joysticks, mice, keyboard, or digital
>> (atari)
> So you can use real joysticks -> cool!

You need a minimal adapter circuit, namely a DB25->DB9 connector, some wires and six 22K resistors. The direction switches of the Atari joystick connect to the four button inputs of the PC game controller, and the button is connected to one of the analog inputs of the game controller by means of a resistor array. The second analog line also requires a resistor array just to signal the PC software that there is actually a joystick connected to this port.

>> - provides an X11 output and - if availabe - SDL graphics output
> Why use X directly at all? Why not just use X11? I know supporting systems
> without SDL, but SDL is meant to be portable...

Well, I'm using the X11 calls directly in the X interface, rather graphical frontend. That's also the fastest way of getting graphic output. SDL output has the advantage that it takes over the screen completely. It obviously does so by means of some X11 calls as well, but I'm not yet competent enough to figure out how precisely.

>> - generates sound thru the OSS sound drivers or alternatively generates a
> How about SDL sound? Then it will automatically use Alsa, Arts or even
> Windows or BeOS sound systems.

Well, I haven't tried yet. The problem is that you need to have a very precise timing, and you also need the ability to check whether writing audio samples into the audio device will "block" your process, i.e. select() is a *must*. I haven't studied the SDL audio chapter close enough, so I don't know whether these abilities of OSS are made available to the user.

>> - comes with documented source code and manual
> You're kidding?

No, really. (-; I wrote a man-page for it.

>> - and has a clear object oriented design in C++.
> Got some pretty class diagrams for it? :-)

Na, no diagrams. I could draw some, I guess, but I think it is quite
understandable, and quite easy to plug in another chip for emulation
without too much hassle.

>> If you're interested, I'll hand out a tar-ball of the sources, ready
>> for compilation, please drop me a mail at thor@math.tu-berlin.de.
> I already sent you a mail -> looking forward to giving it a try.

Yup, arrived fine. Let me know what you think, I'm curious about
improvements and critics.

Greetings,
Thomas

That is great!

Glad to hear that someone is willing to do the projects that most of us can't do because we lack the skills to do so and that most electronic techs probably couldn't do because they don't even know what an Atari is and even if they did know, they would probably charge an arm and a leg for it! I had someone put a 256k in mine and charged me $250!! Maybe that's not unreasonable, but it is when you really can't afford it!

I am just a tinkerer myself. I don't know hardly anything about electronics but I have done a 1 meg Newell upgrade on one of my other machines but it's a bit flaky. I think it needs some additional adjustments that was not mentioned in the docs. I read one time from somebody that if you go beyond a certain point, you need some additional adjustments to it for it to work properly. I don't think I have a copy of that and I have not really looked for it but I sure would like to get a hold of that!

I put together a joystick cable (LPTJoy) for the pc emulator and it worked! But I had a bit of trouble because I am not skilled at soldering so the first time it didn't work. I guess I really should take up a soldering class! I did continuity testing and found one line not working. I opened it up and one of the wires had broke away from the pin. Once I fixed that, I was in business! I was *so* glad to finally be able to hook up an Atari joystick so I can play my old favorites once again without using a lame pc stick, especially Gravis Gamepad! I was tired of trying to play games because the gamepad was difficult to manipulate and would not respond the way I wanted it to. Anyways, if you don't know, this is a really simple cable to put together. Depending on the cable or connectors, it can be done in about 7 solder points! Install the driver and you're off!! I had used a customized cable (MIO, RS232) that had connectors that you could open up and make the changes. This could be another service that you could offer! I think there would be a number of people who would probably want one of these! Maybe, if they still have them, you can use a breakout box? (adapter), if they are not expensive, or find a cable that lets you modify the connectors, make the changes in it and then for a small fee send to whomever wants one. Then they would just use their own printer cable to plug into the adapter and install the driver and they would be set!

So you can do the Stereo Pokey Upgrade and/or just about any OS upgrade there is, ie. Omnimon/view, etc, or multiple OS installations? I guess as long as you know the Atari and you know about the upgrade or have the docs for it, then you can do it, uh? So, can you diagnose and repair problem equipment too? Just being curious, I doubt that I would do one anytime soon as I don't have the money for it anyways.

Some of these I wanted to do on one of my machines but I just don't have enough skills to do it and I am afraid to attempt it, especially after my failed 1 meg attempt. If I had better soldering skills, I probably could, as long as nothing went wrong. If it did, I would not be able to troubleshoot it then or know what to look for, etc, since I don't have the electronic knowledge.

Anyways, it's great that you are offering this service and to anyone who is reading this, I would recommend Technoid highly as he has been around for quite awhile and he can be trusted!

Happy 8-bitting!

Nite Hacker

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-13 13:24:24 UTC
From: Nite Hacker <nitehacker@hotmail.com>
Message-ID: <cclK9.52706$jf7.3309606@news2.west.cox.net>
Source record: 25084

That's really too big of a subject to try to answer here. Since you are just starting out in the emulator world, you really should read the Welcome to comp.sys.atari.8bit message that's posted in here frequently by Michael Current... last one dated 11/28/02. He gives references that will point you in the direction you need to go to get your answers. Main place to start out would be his faq...
http://www.faqs.org/faqs/atari-8-bit/faq/
Then you could also look at http://www.sonic.net/~nbs/new_and_emu.html

Anyways, to give you some kind of answer, simply put... *YES* there are emulators out there for the PC that really work! Some don't work as good as others, so I am going to be biased here and recommend Atari800Win Plus 3.1. This one works almost flawlessly! As with any program, there are a few bugs, but this one has the least.

You just need to tinker around with it until you learn it. It takes a little while to get the hang of it but it is pretty easy to set up and get it running, though, if you are familiar with how an Atari operates and you know the differences between OSes. For instance, some programs require OSB to run so you need to learn how to switch to it and some programs need PAL to run properly, etc.

You just have to learn how to attach disks or cartridges to the emulator or know how to load an exe, com, obj, bin file. Com, exe and obj are usually all the same, if they are classified right, and loaded as an exe file. Bin, rom and crt are usually cartridge files and must be attached as a cartridge in the emulator or they won't work. In other words, you can't use load an exe file with them. Up until lately, cartridge files were not useable in Atari800Win Plus, but with the latest version, they are now! Some obj and bin files could be either an executable file or a cartridge file. So if they don't work in one place, you need to try the other. Some files did not get classified right so you may run into this problem frequently. That may be the case with the other files too, rom, com and exe. I hope and guessing that most crt files are right. So, again, if it doesn't work as an exe then try the cart, or visa versa.

Lastly, you need to know what disk images are and how to use them since this one of the main parts of using an emulator in the first place. Alot of games were on a disk and they won't work if they don't stay in their original state. So disk images need to be used to duplicate their original state. Disk images are mainly a copy of the real disk that is transferred to the PC in some manner and then loaded into the emulator. There are several varieties, but the most common, and useable in the emulator, is ATR, XFD and DCM. ATR is the most common and preferred format of the 3. They are an exact copy of the original disk but with a 16 byte header added at

the very beginning that tells the emulator how to load and use it. So, you mainly need to find ATRs to use with the emulator. There is an abundance of these! Read the FAQs to find out where to find them.

Hope this helps!

Happy 8-bitting!

Hi folks,

a question to our hardware gurus. Is it possible to exchange the 8
DRAM chips in our Atari with 8 SRAM chips without having to many
changes made.

I wonder if that would make the Atari more stable while having a lot
of mods already in.

Regards
Frank

7223. FA : Many boxed (new) ATARI XE carts

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-13 17:37:02 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0212130937.79f087b2@posting.google.com>
Source record: 25094

I have lots of ATARI auctions on ebay , look at

http://cgi6.ebay.de/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=3&rows=25&since=-1&showpics=1&stab=0

There are many great ATARI XE cart games like Rescue on Fractalus,Airball,Crime Buster , Archon,Star Raiders 2 ,Eastern Front,Lode Runner and more.

All these games are boxed , new , factory-sealed and are NTSC and PAL compatible.

Iï¿½ll ship worldwide , take checks/money orders/bidpay etc. for payment.

Mathias

P.S. I also have lots of ATARI 2600/7800 games and Dreamcast games on ebay.

Dreamcast games are PAL and may be only intersting for European buyers.

There is also some hardware , Paddles and Joysticks

I've got a Super-E-Burner, and I wanted to burn a modified OS chip. When I loaded the rom image file, the program states, 'Not a Binary File'. This is correct, it is a rom image. How do I fix this? So I can burn the image.

I think the short answer is no. DRAM uses a multiplexed addressing scheme where the address is loaded into the chip in two parts. Also, a lot of early DRAMS were one bit wide whereas SRAM tended to be four or eight bits wide. The modification is possible but will require some changes to the associated logic (I've not seen the circuitry involved so I can't be more specific). It really depends on what you mean by "too many changes" :-)

>
> I wonder if that would make the Atari more stable while having a lot

>Or are they just bad copies floating around?

Nope, it's an emulator problem to do with the way it handles the
graphics, the emulator is scanline so the very few effects don't work.

Read the Help file to see the list of what is affected.

Unless someone writes an emulator that handles the graphics in that
manner then you may be stuck with these few bugs.

Hope you got my mail as it seems that right in place my mail client crashed. If not, please sent me another one, sorry. /-:

> Wow! This came out of nowhere! How will this be licensed?

Basically my "freeware licence". It allows free distribution on free media, or on a CD if I get a copy. (-; Its something along the lines of GNU, though it is not "viral".

> How does it relate to Atari800, if at all?

Not at all, this project started from scratch. I experimented with the Atari800 quite ages ago, came up with a couple of improvements that, IIRC, made the way into the main branch (GTIA, timing stuff), but after all, the overall architecture of this emulator didn't make me feel comfortable back then (must have been around 1996 or so). Hence, I restarted all this from scratch after I finally got a linux box - last May.

So long,
Thomas

Hi Mathy,

thanks for the contest info. Don't think I'd make the deadline though! You seem to be keeping busy on the Atari, but I have had too many other things to worry about for the past several months, so Space Harrier is only coming on very slowly. I'll post something around Christmas on the site, but don't expect much. Stage 3 will be complete by then. Most of the other changes are not really visible, just better/different ways of doing some things in the code.

Regards
Chris

PS Hopefully your message problems will clear when your ISP just reboots their darned news server.

Source record: 24957

Hi-
> Sounds just like a rana. I have one THAT ACTUALLY WORKS!!!! Most of them...
<

I've had more than a dozen, and have concluded that the mechs are to blame for most of their ills. I keep a "known good" mech, and whenever I get another Rana that is flakey (usually in DD) I swap the mech out with Mr. Known Good, and they work fine. OK, once in a while the 2793 / 2797's have crapped out. Sooo...

My quest has been to replace the Rana mech with a 1050 Tandon mech. I have had some success (power up movement, track seeking, etc.), but can't get them to actually read or write. Separating most of the lines was pretty easy, but the R/W head wiring is different -- 4 connectors on the Rana instead of 5 on the Tandon IIRC.

It is going to take someone who is better with a scope than me to crack this, but I don't think it is beyond reach. Anyone willing to take a look at a hybrid? I have made notes of my adventure thus far. I'll ship the parts if necessary, but natually it would less expensive if our "someone" had a Rana and a 1050...

Larry

Hi Mathy-
> Larry, could you tell me if there is an error in this file? <

I don't think there is. I tested ATR180K.BAS today running under Turbo Basic and MyDos 4.5 with a freshly-baked SSDD ATR image, and it transferred perfectly. You mentioned DSDD (360K).
I never made a 360K version, so I don't know what might happen if only half an image were transferred. If you still think there is an error, please send the image to me and let me test it here.

Hi, Mathy;
ATR2ENH works in both single and enhanced; it was originally single and I encountered a 130K disk so I added the mod for more sectors. Single and enhanced are the same outside the drive except for number of sectors. ATR2ENH just runs out of data when processing a 90K image; no harm no foul... but mostly I just suggested it as an example of resident disk handler usage.

As far as density, I always preformat the destination to avoid surprises. A lot depends on your DOS in use; 2.5 and MyDos both allow some parameters in the XIO format call. I have not used those in MyDos to verify necessity of also using the read and write Percom configuration block.

I've done quite a few of the standard upgrades for the Atari including:

288k 800
256k and 512k 800xl
320k and 576k 130xe
Sio2PC adapter
Rverter RS232 adapter
256k to 1mb MIO
1200xl upgrade to full compatability with XL OS, and 1200xl internal basic.
1200xl PBI mod (which doesn't work by the way so don't ask)
Multiple OS mod (so you can have things like Omnimon and the standard OS and the Mux OS all in the same machine)

I know the Atari computers inside and out. The mods I haven't done, I have at least seen. If I have the plans for the mod, I can do it without much trouble. I make my mods PRETTY also. My 256k and 512k 800xl upgrades are contained on a nice little plugin module I modeled after the Rambo. I call it the "Sly Stallone 512k".

I usually use multi-colored wire of just enough length to make each contact. If you open your newly 'upgraded by technoid' machine you will see a fruit salad rainbow of wireing. Just something I like to do.

Regards,

Jeff

I think by binary file it means a straight byte file. The file you may have might be an intel hex file (which is in a specific format). A binary file is usually a straight dump of bytes from, say, $A000 to $B000.

Tony

7243. Re: Holmes Web Site Down Now

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-14 02:56:52 UTC
From: Aaron Wheeler <holmesatari@hotmail.com>
Message-ID: <N3xK9.1053$j94.224418@news02.tsnz.net>
Source record: 24964

Yep, the site is down as of late Friday night (NZ time). The ftp was getting so hammered, that it wasnt really working well. So I made the call to 'unplug' :-|

Thanks everyone who has made the effort to help build up a mighty impressive collection of stuff. I hope everyone got some use out of the files, be it bringing back memories of your favorite games, or childhood, to those who like to just download 'everything' and never play them. Doesnt worry me which you were, as long as you had fun doing it! ;-)

Thanks to the original authors of the games/utils, for giving us these great games, and some not so great. For without them, this scene wouldnt exist!

Hopefully the other atari archive sites will remain active and will continue to serve the community with some great games. Check out the homesoft site for a good website with a big collection of games.

To answer a few questions I keep getting asked, publically...
Yes I am looking at getting the files online somewhere. Probably Tom Hunts FTP, but I need to talk to him first.
No I wont do it 'right now', It'll be done when I get time, be that whenever it is.
No I dont know when that will be!! ;-)

To those offering to help mirror the site, thanks for the offers, but as I accepted around 4 people over the last 6 months to do this, and it hasnt happened. I'm not willing to waste anymore time trying to turn this into a reality.

To everyone asking for the collection on CD,
Yes I 'could' do a copy for you, but, I probably wont.
Offers to buy the CD's 'may' get you a copy.
Offers to trade for the CD's, will more likely get you a set than money will.
I make no guarantee, that I'll accept your offer! ;-)

Anyway, To those who I still have some 5.25" disks to transfer to ATR, these will be done asap, and you'll be sent a email with them. I apologise for how slow I have been doing these last ones.

The website will turn back into a personal website over the next month, with only a small section on Atari games, probably my top 20 or something like that.

Catchya around

Aaron (aka.Holmes)

PS - Flame wars do nothing but hurt the community, be a man, and just ignore
the trolls.

7244. Soldering tips from your favorite Mutant

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-14 03:32:50 UTC
From: Technoid Mutant <technoid@nospam.30below.nospam.com>
Message-ID: <NxxK9.1823$6z5.780@news.bellsouth.net>
Source record: 24965

I've seen some badly botched work by ernest people. Here are some ways to make your first attempt at 'roll your own' hardware a pleasant and successful one:

Too much power. You need a LOW POWER soldering iron. I use a 15watt iron for anything shy of power supply work. You do the same and you'll have a pretty upgrade that works. A 45 watt gun is WAY TOO MUCH power for most uses.

Use 2% silver solder. It should be very fine guage - something like very thick horsehair. Solder isn't all that conductive generally. The silver is conductive and will be more forgiving of sloppy connections than standard lead/tin only solder.

Use a SPONGE. Your standard kitchen variety is fine. Wet it then squeeze it almost dry. Wipe the hot tip of the iron on it every so often. It keeps the tip from building up all that black crud. The crud keeps the iron from properly conducting it's heat to the things you are soldering together. When you are finished with the gun and uplug it, wipe the tip from time to time on the sponge as it is cooling to keep the tip clean for your next use. If you can't find a sponge, a halfassed replacement is a few damp paper towels folded into a square. Once your iron is up to full heat, wipe it on the sponge and melt some solder onto the tip. Wipe again, melt, wipe, melt, wipe. Do this until your iron's tip is nice and shiny.

'Tin' the ends of your wires and tin the contact your are going to solder to. To tin a contact, just heat the contact with the iron and melt a little solder onto it. To tin the end of a wire, first strip the wire end of it's insulation, twist the end of the stranded wire to keep all the little wires it is made of together, heat the end and melt some solder onto it. Not a big old blob, just enough to make it shiny. One way to do this is to melt a blob of solder onto the iron's tip and then stroke the wire end through the blob. The stranded wire will absorb some of the blob and become shiny.

The chips in your Atari are all pin-ordered in the same way. Pin 1 is the lower-left-most pin, and the highest pin is the upper-left-most pin. Lets take a 16 ping ram chip as an example.

A sixteen pin chip is represented below:

16 15 14 13 12 11 10 9
1 2 3 4 5 6 7 8

You see? lower-left to upper left in a counter-clockwise acending order. For all chips in your Atari computer.

Each chip has a little dit or marking at one end to indicate which is it's "left side". This is sometimes a little indentation, a printed marking, or a semicircular or rectangular indentation at one end of the chip.

The wire that is best for upgrades is 'ribbon cable' wire. Just separate a length from the ribbon and away you go!

Some folks like solid-core wire. While I agree that it is of slightly lower resistance and is a little easier to handle, just flex one once or twice. You'll break a contact. Use what I suggest and you'll have a durable upgrade.

What makes this so cool is that it is generally free and it goes a long long way.

What is also cool about this type of wire is this. It is hard to explain but bear with me and I think we'll get through it.

Imagine your upgrade reads something like; "connect pin 18 of u20 to pin 14 of u6, pin 4 of u10 and pin 11 of u22. That would require three wires and make life for you a hell. In effect it is one wire so why not use just ONE WIRE?

To accomplish this much more easily and with a much higher quality connection, strip a wire twice in it's middle and once at each end. Twist the wire at the bare spots in the middle and at the end. Don't tin the spots in the middle. Instead, make your first connection, then wrap the first bare spot around the connection you need to connect to and solder into place, the same for the next bare spot and then finish your final connection. I need to thank Mr. Larry Bettes of Pinnacle Engineering, Redding California for showing me this trick in 1987. Give Ruthanna a kiss you dirty old man! Thanks Larry! Wherever you are....

If the connection you are making in the middle of the wire is not one you can wrap the wire around, then tin the bare spot and 'tack solder' it onto your tinned connection. If there is bare wire still visible after you've finished soldering, you can sortof 'streatch' the insulation down the wire to cover it up by running your fingers vigorously down the wire in the direction of the area you want to cover up.

If you need to make a hole in the case (as for a switch or whatever), you don't need a drill. Use that 45watt flamethrower of a soldering iron I told you never to use. Just poke the hot end through and trim the melted plastic with a sharp knife. Viola! Instant hole! Do this from the inside-out if possible to keep it looking neat.

Well, thats it for this edition of Instant Tech by your favorite Mutant!

Stay tuned for more such articles on the Atari8 usenet group.

Jeff

That's cool, glad to hear that you can do such mods and do it for a reasonable price!

We need someone like that to keep our machines going and to do upgrades that we may wish to add on but can't do it ourselves! I am glad you have stepped up to the plate!

So, I guess, you might have missed it in my jungle of an email, can you repair broken down computers and disk drives, etc, too?

Also, does wire-wrap come in different sizes? Also, where is the best place to get some?

Thanks,

Happy 8-bitting!

Nite Hacker

Tony is right, you are missing the standard Atari file header which
starts with FF FF to indicate a binary file vs a text file. Which
is then followed by two more bytes that indicate the 'load to'
address followed by two more bytes that indicate the 'end load'
address. The super eburner uses 00 00 for a start address to
FF 3F for a standard size (27128) Atari OS eprom. The code actually
doesn't come from there or go there either - the super eburner
software just throws the six header bytes away in any case - but they
do have to be there in order for the file to pass muster.

So add FF FF 00 00 FF 3F to the start of the .bin file you wanted
to burn with a hex editor and try again. Multiple headers are OK and
even a necessity when dealing with burn files for 27512 and up. In a
pinch without a hex editor I have been able to 'prepend' such data to
an Atari file by using a dummy sector on the same disk as the .bin file
with a sector editor. Its involved but it does work.

>
>pr

Sorry, this may be getting off topic, but let me finish with this...

He uses AVG (what is AVG?) and I use McAfee and they both said there was a virus.

You know, there is no one perfect virus scanner... you are safer to use 2 different scanners. I thought I was safe with McAfee but was disgusted to find out that a virus still got through and into my computer. I had to use Trend Micro to find it and get rid of it.

I agree with pr, though, even though it may be safe code he should try and remove it. Alot of people will not visit his site if that pops up. If 2 scanners pick it up, then there may be others that will too, such as Trend Micro. People may not even see his webpage and to see his note about this problem. If he is in business or trying to sell products, this will hurt him.

Just a suggestion for him... whether he wants to remove this code or not is up to him.

Happy 8-bitting!

>How long did it take you and what did you find most interesting about the
>game?

I play versions 1-6 of Ultima on the Atari computers. Ultima, in
my opinon, is the RPG game ever and I am sad that it stopped after
version 10. Of 6 versions I played on the Atari, IV was the by far
the best. I really cannot remember if I had help as I do not
remember getting any, but I finished it in about a year. I know
that is a long time, but I like to savor these kinds of game and
do not finish them too quickly. I usually start being a wizard and
like to build my character up before I tackle the real quest of
the game. That is what I am doing now on the Xbox with Morrowind.
Ultima IV was not too easy, but not too hard to finish on your own
without any help. That is what I liked most about it. The
graphics, gameplay and MIDI muscic made the game. I plan on
playing it again sometime just for fun.

Hi Ron-
> I once saw an article (maybe AIM mag) concerning replacing the Indus mech with a 1050 Tandon Mech... <

Yes, that is an excellent article, and it definitely helped me trace the wiring, but Indus used Tandon's, so the head wiring is the same. (Although I had one Indus that used a stock IBM-type SS drive!)

I have schematic info for both head assemblies, and *I think* I have the Tandon connected to the appropriate Rana connectors, but it still won't R/W. It was suggested to me that the impedance may be mis-matched, and going back to my old hi-fi days, that sounds very plausible.

I'm stumped, and I just not swift enough with a 'scope to get any further. But I truly welcome any constructive suggestions.

Larry

Richard,

Hopefully you got my lengthy email and programs to help you with the issue.

> So add FF FF 00 00 FF 3F to the start of the .bin file you wanted
> to burn with a hex editor and try again. Multiple headers are OK and
> even a necessity when dealing with burn files for 27512 and up. In a
> pinch without a hex editor I have been able to 'prepend' such data to
> an Atari file by using a dummy sector on the same disk as the .bin file
> with a sector editor. Its involved but it does work.

That's an interesting method described. Does sound tricky. But must involve some tricks with the last 3 bytes of the sector to get the linking to occurr correctly, correct?

One of the tricks that I provided Richard was a basic program that will write the necessary 6 byte header to a file. Then go into Atari DOS and use the Copy File command 'C' and do an append operation (i.e. 'C' followed by D:ROMFILE.BIN,D:HEADER.BIN/A).

Looking at some stuff related to Spartados X I see the POINT cmd in basic can do relative positioning within the file. Maybe possible to use Spartados (maybe 3.2 and X) to actually insert the necessary bytes within those large files. Or at least write a utility that can insert the bytes at the beginning of the smaller files.

Now I do remember that Super-E Burner works in 16k size chunks. Doesn't the 27256 size chips ROM images require the mulitple headers too?

Boy, if the source to Super-E Burner was available, maybe it could be modified to allow just straight binary image programming then all this file image modification wouldn't be needed... (maybe add support for Flash chips also!).

Glenn

If you can ever get to some of the electronic swap meets in the
San Francisco East Bay area there's one that meets in Livermore
on the last Sunday of each month. You can usually find older EPROM
burners there for around $20.

Good place to search for test equipment also.

I saw some posting of old 80's commercials on alt.binaries.vcd

They're all MPEG and around 5meg in size.

Here are the commercials:

Commercial - 1982 - Dinky Doughnuts - Win 2600 or VCR.mpg
Commercial - 1982 - Imagic - Cosmic Ark for Atari 2600.mpg
Commercial - 1983 - Nestle Quik - Atari 2600 Co-Brand.mpg

Sorry, Jeff;
Sounds like you have had a bad run of encounters with a lot of hardware. My experience is better, though somewhat limited; I have three AT Percoms, but have used only one 810, 1050, Indus and ATR8000. All of them are still cranking and providing good service with the exception of a flaky write protect on one Percom and unknown status of the Indus which was borrowed for several months. I agree that the 810 was built like a tank and the 1050 seemed to run forever while looking a little less beefy. Ben the 8-Bit Alchemist documented the correctable flaws in the fairly solid Percoms back in a '95 Atari Classics article. What problems did you have with the ATR8000? The power and reset switches were the only moving parts; did you get some bad 3rd party mechanisms?

It's not *that* involved and highlights the flexibility of 2.x type Dos for
using the sector count byte to patch into a file.

7268. Announcement: cc65 version 2.9.0 released

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-14 17:40:03 UTC
From: uz@remove-to-reply.musoftware.de
Message-ID: <jdqfta.hk9.ln@news.musoftware.de>
Source record: 24989

I'm proud to announce version 2.9.0 of CC65, a C crosscompiler /
crossassembler combo for 6502 systems.

CC65 has C and runtime library support for many of the old 6502 machines,
including

- The Commodore VIC20 (contributed by Steve Schmidtke
<steve_schmidtke@hotmail.com>).

- The Commodore C64 and C128.

- The Commodore C16, C116, Plus/4.

- The CBM 510 (aka P500), a quite rare Commodore machine (programs
run in bank 0).

- The CBM 600/700 family (programs run in bank 1).

- Newer PET machines (not 2001)

- The Apple][(library support by Kevin Ruland <kevin@rodin.wustl.edu>)

- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler
<cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga
<taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).

- GEOS for the C64 and C128 (GEOSLib by Maciej Witkowiak <ytm@elysium.pl>)

There is also rudimentary support for the Oric Atmos (startup file and linker
config, but no library support) contributed by Debrune Jï¿œrï¿œme <jede@oric.org>.

The libraries are fairly portable, so creating a version for other 6502s
shouldn't be too much work.

New features in this release are:

* Assembler:

- In the .local directive, transfer the local char to the created
symbols, so ".local @L1" will create cheap local symbols in macros.

- New commands .PUSHSEG and .POPSEG to save and restore the current
segment.

* Compiler:

- Optimization for memset (call bzero if fill value is zero).

- Better handling of unknown pragmas, support for _Pragma().

- Local variables of compound type may now be initialized.

- Register variables are back again and they work better than ever before!
The plasma demo has a speed increase of 30% using register variables,
the fire demo more than 60%. Note that these are special cases (small
loops with a high loop count), so these numbers may not be typical.

- More optimizations, especially register variable related ones.

* Linker:

- Support for more o65 attributes and "simple" o65 files

- The linker is able to generate cc65 specific o65 modules.

* cl65 utility:

- Output the command line for the subprocesses when -d is given

* Library:

- A module loader allows to load o65 extension modules at runtime. These
fully relocatable modules can be used as drivers, overlays or whatever.

- Completely new graphics library (currently supported: C64) using
loadable graphics drivers.

- RS232 module for the Atari (written by Christian Groessler)

- New _randomize() function for all platforms

- Complete set of functions from time.h. All that has to be supplied
is a machine speficic _systime function.

- Most CBM file functions are now written in assembly.

- C file I/O support for the following platforms: C64, C128, C16, C116,
Plus/4, VIC20, PET. This is probably one of the most requested
additions!

- New API to access extended memory with loadable drivers for:
C64 with GeoRAM cartridge, C64 with REU, C64 using RAM behind kernal
and I/O area. C128 with GeoRAM cartridge, C128 with REU and C128 using
the RAM in bank #1.

* Platforms:

- Some small improvements for the Apple][:

o revers() should now work correctly (do nothing)

o Binaries have an AppleDOS 3.3 header

- Support for VLIR files under GEOS

- Minimal support for the Oric Atmos (just the startup file - contributed
by Debrune Jï¿œrï¿œme)

- Support for the VIC20 (Steve Schmidtke). The standard linker config is made for the standard memory setup (3.5K) which is too small for most serious things. You have to use an external memory config when linking for a VIC20 with memory extension.

- The C16/116 and Plus/4 are now separate platforms. The new Plus/4 target does banking and supports up to 59K of memory, while the C16/116 works without banking (and the overhead) and supports up to 28K. Both are still compatible, so C16 programs will run on the Plus/4, and Plus/4 programs will run on an expanded C16 or 116.

* Documentation:

- New function reference (incomplete)

* Bugfixes and minor improvements as usual.

There is still no support for the following features:

* Floats and bit fields.

* stdio file routines on some systems.

* The 80 column mode on the C128 is not supported by the conio library.

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target systems you need the compiler RPM package *and* one of the target machine packages.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages.

Download:

For more information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Mailing list:

There is a mailing list for discussing cc65 related issues (programming, suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

```
-----------

Thanks to all who sent feedback and suggestions, and of course to anyone who
helped developing cc65!

<snip>

You forgot to mention a couple things:

-a soldering iron is not a pen, don't try to hold it between your fingers from near the tip. (happened to me once when I was distracted trying to get the solder in the proper position and then grabbed the iron without looking at it, after a while I noticed a smell somewhat like a barbecue, followed some instants later by a sceam of pain coming out of my mouth...)

-if you're too tired and/or it's too dark, *don't* attempt to do it - leave it for the next day, after you've had a good night's sleep; you may later regret it if you don't.

It would require a rewrite of the core which I would imagine is a
lengthy process, it's certainly *not* on the Plus to do list unless
either the core person(s) from Atari800 are planning it and a 3rd
party redoes the sources with the new code.

Maybe another emulator will emerge at some point, I know there was
talk of another emu at some point.

Does anyone remember a "joke" program for the Atari that I think was called "Crazy DOS"?

My memory is a bit fuzzy, but it did such things as when you selected "Run DOS", a little stick figure would run across the bottom of the screen...stuff like that....

Does anyone know where I can find this program?

I've had several Percoms, several ATR's, several Ranas and several Indus Gt's. Some were even NEW. If I were to rate them in order of excellence, I'd say Indus, Rana, Percom, ATR.

It isn't as though they were badly made. The Percom and the ATR in particular are built very strongly indeed! It is that they can't read thier own disks much less interchange between other drives reliably. If I've run as few as fifty different drive mechs on the ATR and Percom Controllers I'd be surprised. I have over 400 floppys stored for my 8-bit and every one was written on my old' super Archiver 1050 with bitwriter. That way I can still read them a week after they were written.

I've tried dialing the mechs down to 288rpm and other tricks. Nothing seems to help. I never understood why, but the only really solid replacement disk controller for the 8bit I've seen is the Black Box Floppy Board by bob puff. Hey BOB! Wanna get in on this? Why do the other controllers suck so badly?

My friend Kenny Sallot (The Timelord) and I ran a bbs named "The Tardis" on a percom and an ATR8000. We ran four 'quad density' 720k drives. Every few days we'd create a new set of disks because we KNEW the board would eventually die if we just let the old disk set spin. After about a year of that we moved the board to an MIO-driven 20meg Seagate hard disk. Whew! What a relief!

Regards,

Jeff

SRAM is configured more like ROM than DRAM, so you don't wire in 8 SRAMs,
just one. Works great, but most Atari problems are in the clocks and such,
so it doesn't make it more stable necessarily...

Does it have to be in his message? What I find offensive is on his site.
He denigrates me (as a sometime Atari refurbisher and auction seller) and
others in these groups to increase his business. What if his site said,
"Don't buy from black people, buy from me, I'm white" but it didn't say that
in his message? Would you think it was trolling if someone wrote, "Hey,
don't go there, look what's on his site".

I don't call him names, I don't complain to his ISP, I'm not the jackass
posting anonymously. I'm just pointing out what I find offensive and
offering a link to a seller that doesn't knock one part of the already small
Atari community for personal gain. If that "anti-auction" page wasn't there
I wouldn't care a bit about his posts.

Trolling implies posting in such a way as to invite responses. The only
response I was inviting was an answer to my question from BS. There was
nothing inflammatory about my posting.

As for posts to st, it's true you won't find anything from me there except
for these followups. I'm an 8-bit guy...

Does this page do anything except put up stills and captions for anybody?
On my system (Linux with Opera, Galeon, Mozilla, and even IE under
Crossover Office), I get a page with a bunch of stills, but that's it --
they don't seem to be links of any sort. Even the "back" button at the
bottom of the page is just a graphic with no functionality.

You got it, including making the directory entry point to the dummy
sector so it gets loaded first. Ron is also right in that it is not too
involved, but if you have to ask how then _maybe_ it is.

>
> One of the tricks that I provided Richard was a basic program that

Oh yes, there has just got to be a dozen ways to get it done, I'm sure.

> Now I do remember that Super-E Burner works in 16k size chunks.
> Doesn't the 27256 size chips ROM images require the mulitple headers
> too?
No, but that size is the break point for that size default header is
FF FF 00 00 FF 7F and if you'll think about it, the super eburner is
an 8k cartridge so it moves the display list down to 9F20 so not much
more room left over. What I meant to convey by using the
multiple header lingo was that Mac/65 assembled code would burn fine,
even considering that Mac/65 segments it's output in sector sized
bunches. Which really adds up to a lot of those multiple file headers!

>

Other devices would be nice, no arguement there. I can live with the
file system as is though - but I do try to do all file modification
on the PC as that's the where its the easiest to do.

7284. Re: Ultima IV

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-15 05:45:43 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3dfc15ba$1_4@news.teranews.com>
Source record: 24905

When I first received Ultima IV, I had an idiot try to convince me that "avatar" meant satanic and that the game was satanic. Imagine my surprise when I found out that my goal in the game was to become honest, compassionate, valorous, justified, sacrificial, honorable, spiritual, and humble. I never saw this person again, but I hope he found out some time in the future what the game was really about and felt like an idiot for saying this(or is reading this now).

One of my problems on Ultima IV was the fact that I was playing it on a black & white television. I was looking for the mandrake for a long time, and it was right under my nose. At the place where mandrake is located, the background and the location of the mandrake blend together in a black & white setting making it difficult to see. hint: in the Atari version, if you allow a monster to attack you while he is on the swamp land, and a treasure chest appears, you can stand on the treasure chest while you "search" for mandrake, and you will not become poisoned for being in the swamp land while you search.

As for myself, I had "zero" help from anyone with Ultima IV. I admit ONE single thing that I cheated at however, it was when I could not for the life of me figure out how to develop "humility" so that I could gain that virtue. Since I ALWAYS answered every question in every sense, over and over, so I could drill each character with every single clue I could get, my humility went up and down as I asked the questions. I played for months and could never gain in humility. So, I opened up a "sector editor" and made myself an Avatar in the virtue of humility. It finally clicked when I was an Avatar and a little girl in Britannia asked me if I was an Avatar, I answered yes. Poof, "I lost an eighth". Humility.

Other than that, that was my only cheat. The MANTRA for humility took me near forever to finally figure out, but eventually I read carefully what was told to me when I asked for the mantra and figured it out. It was a pain in the butt too, because at first I did not have the horn and kept having to fight my way through to the shrine. Even with the horn, it is a bit of a pain in the butt.

Now, I can win the game in about a week or two. It isn't quite so difficult.

I have never won Ultima 5, but I have played it a whole lot and really enjoyed it. I was disillusioned after Ultima 6. The format of the game changed so much, I was not interested anymore. I enjoyed to two dimensional easy to see layout from the previous Ultima games. I have the CD of all the Ultima games available, but I do not play any of them past Ultima 5 anymore. Also, I played the original Ultima I game before they changed the format to be a bit different.

For those that want to win the Ultima IV in about a week....

Become a mage (honesty). Go to Moonglow and buy 99 of each reagent, giving the supplier only 1 gold each. That will make you very dishonest, but you can always get that back through playing the game in the long run.

Now go to Lord British's Castle and get all his gold near the guard room. Up to 9,999 gold. Again, very dishonest. You can go up and down the ladder in the top-left hand corner several times to replenish the gold. You can ask Lord British his "health" to get healed several times while you take his gold. In the end, you may be poisoned too, there is a healer in the castle as well.

With all this gold, now you will need some keys. Go buy some at the nearest guild. It may be easier if you buy a horse in Paws, just south of the castle and then ride the horse to the guild.

Back to the castle, now go to the door in the back of the castle that leads to the dungeon. Unlock it and go in, then cast the "X-it" spell. You now have a nice balloon to travel in (until you find a ship). Maneuver the balloon with Wind spells to Buccaneer's Den and buy some Magic Wands and Magic Bows.

Go back and forth between the castle and the den till you have 3 wands, and 3 bows.

You now have everything you will ever need to survive and advance quickly. I suggest getting the nightshade and mandrake to boot. Play the game and be honest and develop your virtues. There are plenty of "walk throughs" available online to get you through the rest. As an add on to boot, you may wish to visit the dungeons and gain your strength, dexterity, and humiliation quickly by touching those magic balls, using the Z-down, and X-it spells to get in and out quickly.

Hello Atari friends,

The Atari Bit Byter User Club (ABBUC e.V.) is currently working on a information page about ATARI Computers, called the "Infothek" (URL --> http://www.strotmann.de/twiki/bin/view/Infothek/WebHome). The goal is to collect as much as possible about

* Magazines
* Books
* Disk-Magazines
* Internet
* CD-ROM
* Blueprints

related to the ATARI 8bit Computer.

Because the Infothek is a so called WikiWeb (see --> http://www.strotmann.de/twiki/bin/view/TWiki/WelcomeGuest) everyone can contribute. Today most information is in the Books-Topic. We also plan to request the publishing rights for books, so that we can publish old ATARI Books online on this page.

Best regards

Carsten Strotmann

Here you go.

CIOV = $E456
ICCOM = $0342
ICBAL = $0344
ICBAH = $0345
ICAX1 = $034A
ICAX2 = $034B

LDX #$60 ;use channel six for the S: device
LDA #$0C ;command to close channel
STA ICCOM,X
JSR CIOV
LDA #$03 ;command to open channel
STA ICCOM,X
LDA #<SCREEN ;get S: string low address
STA ICBAL,X
LDA #>SCREEN ;get S: string high address
STA ICBAH,X
LDA #$18 ;this clears screen + text window
STA ICAX1,X
LDA #$04 ;this tells CIOV you want graphics mode 4
STA ICAX2,X
JSR CIOV ;call Central I/O vector
.
.
.
;put the following somewhere in your program data storage area
SCREEN .BYTE "S:" ;needed by CIOV

After the last CIOV call you will have a Graphics 4 screen with Graphics 0
text window. If you don't need the text window, then change the $18 to $08.
Reference pages 83 to 87 of Mapping the Atari for more info about doing
```

CIOV call parameters.

I got the same thing. But I noticed on my router that there was a file
download going on. After downloading the file the movie eventually came up.

Try right clicking on the movie link and saving it to your harddrive and
then open it.

yea, I had that and played with it a bit. pretty funny stuff at the
time. I have it here on some old disks but cannot access them at
present. 1050 doubler died on me.

Which home computer manufacturer of the eighties were you most loyal to?

Please cast your vote at:
http://www.vintagehomecomputers.com/

VHC is a collection of vintage computers of the eighties and nineties. It features a large number of photographs of selected computers, and it is completely advertising free.

Hi,
I'm right now uploading your games and utils (which I grabbed 1 or 2
months ago) to frohikey's ftp. He's going to post them on his website
(http://idiology.com/8b/) or make a new one for them. The only thing
we miss are the docs, which never seemed to be available. Do you think
it would be possible for you or your lucky cd winner to upload them to
frohikey?
Also, it would be nice to have your web pages too, so to keep your
site really alive.

Thanks

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Concerning "master of the lamps": It seems to work fine under the atari++
emulator (see the post above). Maybe I'm missing the point, but I don't
see any special "dirty tricks" in this game, i.e. no horizontal kernel.

Greetings,
Thomas

7303. Off topic: PC without disk drive

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-16 09:33:33 UTC

Howdy folks

I've got a question that is slightly off topic, here goes:

Last friday I accompanied my best friend while she bought herself a new PC.
People had told here this was a very good PC, so she took here savings and
bought the new computer. When we got to here home and unpacked the
computer, she discovered that it didn't have a disk drive. It has
connectors for just about everything, but no disk drive. You can imagion
how she felt when she discovered it didn't have a disk drive after spending
this much money. (for a PC it wasn't an extrordinary amount, but to her
(and me) it was a huge amount of money).
We checked the pictures on the box and in the manual, no disk drive. Then
she called the help desk. They told her the 3.5" drive (which can be
retrofitted) was left out intensionally.

Is this common these days, to sell a computer without a disk drive?

CU Mathy van Nisselroy

Thomas,

Have a look at the gongs after the flight thru space, all the gongs
are meant to be different colours so when the genie (?) plays you the
notes you can copy them by colour on the correct gong.

Whatever trick they did to get the gongs different colours (not looked
at what mode they are using) it falls over under Win Plus and fails to
show the 'right' ones.

Ah, ok, I see the point. The problem is that the game most likely uses
a horizontal kernel to get the colors right here.

So long,
Thomas

It isn't all that unheard of these days. Most software comes on CDrom. It saves the manufacturer about $20.00 and some screws if they don't provide a floppy drive. We are talking about a floppy here aren't we?

At any rate, I doubt very much your lady friend will have much use for a floppy drive, but if she does you can buy one super-cheap and just drop it in the machine. I must have half a dozen spares laying around as do many other tech-type people.

Regards,

Jeff

does anyone know of a utilitiy for Windows that will let me ZIP a collection of, say, ATR or other Atari files in batch mode and unzip them in batch mode, make sense?

PROGRAM1.EXE becomes PROGRAM1.EX_ or PROGRAM1.ZIP
PROGRAM2.BIN becomes PROGRAM2.BI_ or PROGRAM2.ZIP
etc.

instead of zipping all files in a directory into a single archive, i want to zip files in the directory individually (kinda like the old Windows 3.x installation disks) but in bat mode and extract in bat mode.

Suggestions?

Yep, and with the emu being scanline and not pixel exact (got it the
right way around this time) the effect sadly gets trashed.

```
At a DOS prompt:
for %f in (*.exe) do pkzip -add %~nf.zip %f

or if it's in a .bat file it would change to this:
for %%f in (*.exe) do pkzip -add %%~nf.zip %%f

%f (%%f in a .bat file) is a simple variable that gets filled with the name
of each file found in the parenthesized wildcard. The ~n takes off the file
extension. Then you can do what you want with the result. For more info,
do "for /?" at the DOS prompt.

Slor

7319. eBay auction - Page 6 issue 2 - price reduced

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-16 20:48:26 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1040071656.18322.0@doris.uk.clara.net>
Source record: 24940

Hello All,

Well, nobody seemed to want to pay 8pounds for a mint copy of Page 6 Issue 2, so I've reduced the opening bid down to 4pounds. The new link is:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1946111971

This is only a 7 day auction, so get bidding!

I've also added a couple of new items, so be sure to click to see my other auctions while you're there.

Dean Garraghty

Yeah, no doubt... I got one of these a while back - good quality cable.
Plus, I got good email support when I had a question after the purchase.

> PROGRAM2.BIN becomes PROGRAM2.BI_ or PROGRAM2.ZIP

this does zipping (creates original.ext.zip)
for %f in (*.*) do izip %f.zip %f

renaming by 'ren *.exe *.ex_'

unzip *.zip does unzipping

(doing with info-zip).

Although it's probably worth 8pounds, it seems that with christmas almost upon us, that the ebay prices are staying fairly low, and less bidders, compared to earlier in the year. Probably just not the best time to list it. :-) I was selling heaps of stuff in Nov, but now in Dec, the sales are down.

There is a disgruntled customer out there making lude comments about the owner of Bravo Sierra Computers, Ben Smith. The person who is doing this to Ben began doing it using his regular log-in name. Then, after Ben complained, the person continued to do this under an anonymous log-in. Also, he was setting up his news posts to make it look like Ben had participated in some of the writings. He did not. Ben Smith is an honest, fair businessman who is being unfairly treated in the newsgroups comp.sys.atari.8bit and comp.sys.atari.st. I have bought software and a book from Ben, for my Atari 800XL, and I plan to purchase Microsoft B.A.S.I.C. and a power transformer for my second 1050 disk drive from him after New Years' Day, 2003. The 1050 Drive was purchased on e-bay from another vendor. Take my word for it - I am working on my Associate of Science Degree as a computer programmer, and have enjoyed computers since I was 13 years old. I am now 33 years old. Here is what I wrote Ben, after recieving my latest order:

Dear Ben,
>
>
> Thank you, my friend. With DOS 2.5+ and the 1050 Disk Drive
> manual, I was able to boot my Atari 800XL into DOS 2.5+, make a back-up

What do you mean "real"? Compare other auctions: minimum s/h charge is always
in the range of few dolars. Some sellers are charging like $30 to ship a
computer mouse. My minimal s/h charge is $7, not $10 - for $10 I ship 2 meters
of this "wire". Not really verly light. That is very comparable to what other
sellers charge for DOMESTIC first class mail. Take into account that this is
international Priority mail - the only feasible option I have.
Of course actual money I pay at the post office is NOT the same I charge for
s/H. But I do have to buy an envelope, go to the postoffice etc. If you think
my s/h charges are unreasonable - well thats tough. BTW - what would you
suggest?

j131

7333. BBS Software / Disk recovery

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-17 12:29:33 UTC
From: Flatline <jkropp@yorku.ca>
Message-ID: <JMEL9.3040$B_6.623239@news20.bellglobal.com>
Source record: 24854

I wrote some BBS software for the atari 8bit w/spartados in assembly many years ago, and just started going through my old stuff. I'd be happy to release it as public domain but I cant get my old disk drives to work, or my pc floppy to read my old double density spartdos disks. If anyone would like to volunteer to convert my disk to pc format for distribution i'd gladly send you the original floppy. At this point I'd just like to recover the source for nostalgia, but it may take more hardware/talent than I have. I cant even be sure the disks still work, although they should, they've been stored safely and the ibm disks that were in that box work fine.

Feel free to contact me in email if you can help.

J (jkropp@yorku.ca)

Use gzip (GNU zip), same algorithm, works on single files only, you
even save some Zip overhead and batch programming.

See http://helpdesk.uvic.ca/how-to/support/msdos/gzip.html

Or use Bzip2, better compression, same usage.

Dos Versions --> http://www.rahul.net/dkaufman/

If you need a version for other OS (Linux, BSD, Windows 32bit ....),
Google for it or send me a mail.

Ciao

Carsten

Thomas,
Do you have any idea where I can fint it? I'd prefer ATARI binary but a PC
clone will do.

Thanks,
Jerry

Yes. The music was a theme that, I think, was used a lot in early movies
with no speach .. like Charlie Chaplin movies. Maybe it's just me who makes
that connection based on some memories from my childhood.

The Sting, you mean ? The tune is The Entertainer then. Couldn't remember,
but if it's the theme to The Sting, that's the one. Nice sounds.

All current Apple computers do not have a floppy drives. Its nice to
see PCs following. With Compact Flash, Smart Media, and Memory Stick
storage and readers dropping in price there really is no need for
floppies on todays computers.

7353. TopDOS Professonal

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-18 06:19:05 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3E001359.20008@one.net>
Source record: 24874

Since I had some free time tonight, I was able to play with my Atari.

I finally _opened_ the box from Sijmen with the MyIDE interface. I should have done that sooner. I was impressed with the looks and documentation of the product. I can't wait to get it installed.

I also experimented with the few DOS programs I have. In my TopDOS package, I have the "First TopDOS Newsletter" dated January 1987. In it, there's a description of the various versions and prices for TopDOS. There's a paragraph on "TopDOS Professional":

"We have released the TOPDOS PROFESSIONAL, which has a number of new features, including sector operations, file compare, double-size directories, subdirectories, disks to 65535 sectors, multiple commands per line, disk drive speed, logical/physical drive# mapping, hex add/subtract, directory alphabetization by extension name, listing first sector numbers of files, changing text in memory, multiple disk duplication, and MEMTOP relocation. It is priced at $100 and available only to TOPDOS customers who really appreciate TOPDOS and who are in a position to protect it from pirates. If you are interested, send a SASE (Self-Addressed, Stamped Envelope) for information."

Anyone have this version?

My copy of TopDOS is version 1.5+ v1a

-Bob

Hi and thanks for those links for a newbie such as I (in this realm)

I will check out the FAQs and such.

While I'm at it... you mention disk images. For starters, where do I get them? Also... I have myriad A800 floppies with software and games. Is there a way to use THOSE? To somehow load them from the Atari floppy to the PC?

Please let me know... or if it's in the FAQ, I can read it there.

Thanks!!!!

Howdy folks

During christmas break I want to test if creating a new Phase2 signal out of the phase zero signal will cure the timing problems my 800XE is having.

I'm gonna use a 74LS74 (see Dan Vernon's page, the Alternative CPU mod by Guus Assmann, he uses a 74LS74 too. And so does the 400/800).

Question:

Should I use the input or output pins an the LS08 that already ANDs the existing Phi2 signal (the existing Phi2 will be disconnected)? What pins shouldn't be left 'non-connected', input pins or output pins?

CU Mathy van Nisselroy

As one of the responses pointed out, +5V LED's are available, so while I was in the local Radio Shack, I looked and found one labeled as Red 5 Volt. A little pricey at $.99 ea., but not bad for RS. Nice and bright -- much brighter than the previous RS LED with a resistor added. I've been moving rear-mounted power switches on some of my drives to the front along with a power LED, if none was already mounted.
Larry

7362. Name this game. Thanks.

There are now new computers available for trade on my website.
I prefer trading for MSX stuff, but you can always mail me an offer :-)

http://www.msx.be.tf

"New" stuff available for trade:
- 3 x C64 + external floppy drives + ...
- 5 x Schneider Euro-PC (rare, only one has a power adaptor so be quick!)
- 1 x Commodore CBM 3032 (rare, make good offer)
more coming soon (tomorrow I should get some new machines, and saturday
too...)

Greetings.
KG.

Has anyone created any good adventures for this Adventure Creator by Spinnaker?

I wonder how hard it would be to create a "compiler" or "runtime" for adventures created with this program?

Just random thoughts.

The best place I know of to find Atari 8-bit disk images is:

http://www.newbreedsoftware.com/xlsearch/

> Also... I have myriad A800 floppies with software and games. Is
> there a way to use THOSE? To somehow load them from the Atari floppy to the
> PC?

Possibly. This section of the FAQ covers the question:

http://www.faqs.org/faqs/atari-8-bit/faq/section-59.html

It's usually possible to read SS/DD disks, but other formats are
trickier. If you've got a working Atari disk drive, you can also connect
it to a PC using a variant on the SIO2PC cable (see
http://www.tcainternet.com/wa5bdu/sio2pc.htm), called the 1040-2-PC. Of
course, if it's standard software and not personal data or software
you've written, you can probably find it in the archives.

1050-2-PC is a hardware interface device that works with SIO2PC to allows a 1050 drive to be connected to a PC. From the drive's perspective, it is connected to a genuine Atari.

You use the drive just as you would on a real Atari: read, write, and copy disks. For more info, see http://www.tcainternet.com/wa5bdu/sio2pc.htm (verified working seconds ago).

That would be *awesome*. I have the cart and have played around with it
but didn't do too much with it since I couldn't share my creations.

Has anyone dumped the cart? Would it be possible to set up a cart
dump to automatically play your adventure (so you could just
distribute a disk image)?

LAtely I've been interested in that particular Atari. I've always wanted one, but never got one; just the 800XL, which was cool but didn't look as good as the 800...I could easily get one off of eBay, or pick one up in a rubbish heap or whatever, but what would I be able to do with it? I'm fairly knowledgable about BBS services, I've read about people using their 800s for security and ham radio purposes but nothing recent; what would someone with a reliance to a present standard PC do with a 20+ year old computer besides having a clunky conversation piece?

Just digging for info..I'm interested in tinkering with elderly computers..

Hi,

> The Sting, you mean ? The tune is The Entertainer then. Couldn't remember,
> but if it's the theme to The Sting, that's the one. Nice sounds.

The music is "The Entertainer" by Scott Joplin (a ragtime tune). It is the
film music to "The Clue" with Paul Newman, btw.

So long,
Thomas

Howdy Eric and Jeffrey

> All current Apple computers do not have a floppy drives. Its nice to
> see PCs following. With Compact Flash, Smart Media, and Memory Stick
> storage and readers dropping in price there really is no need for
> floppies on todays computers.

Yes I was talking about a floppy drive.
Silly thing is, the computer has slots for all the stuff Eric mentions, but no floppy drive. It can be added but only by a professional, otherwise the warranty will be void.

7381. How does USB work?

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-19 12:56:18 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <atsfll$r25$1@nets3.rz.RWTH-Aachen.DE>
Source record: 24752

Howdy folks

I've been thinking, what happens when a USB device is detected? Does the device say, 'hey, I'm a webcam/printer/whatever' and does the operating system then find the correct drivers or is the driver loaded from the device?

7382. atari++ 1.01 release

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-19 14:05:47 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <atsjnrecg1@mamenchi.zrz.TU-Berlin.DE>
Source record: 24753

Hi folks,

a new version of the atari++ emulator is ready for release. Besides
several bug fixes, the following new features are available:

- Improved the disk-drive built-in .EXE bootstrap code.
- Added snapshot files to put the machine state on disk.
This allows to save a game in the middle of the game
play and continue from that point later on.
- Integrated 5200 game console emulation.
- Fixed/improved cartridge management: The menu will now show
only the useful cart types for the selected file.
- Added SDL sound support.

Greetings,
Thomas

Lots of reasons. Nostalgia. Lance Renquist uses an old 8 bit (not sure which one) for his business as go a couple others. Some games no matter how old or how crude the graphics still are fun to play after all these years. The 800 in particular had 4 controller ports so a few games really did take advantage of this feature. another feature that a few programs took advantage of was the dual cartridge ports (such as Monkey Wrench). besides, IMHO, the keyboard has a nice clean crisp feel.

Well,
I don`t get the name right now. It exists in two versions: version one
has to do with a dinosaur (2 million b.c.) and a volcano; version two
features a medieval background with the knight and other obstacles;
author of both games was David Castell. I have these games in my
collection, heck, I don`t remember their names... -Andreas.

P.S.: both games have nice graphics, but some tricky/difficult
controls...

oh my god! Poland, I did not see that so I must apologize. I know
international shipping is high so I am sorry. I better start using my
eyes before I speak. at that price I may just buy it myself and do
away with mine that DOES have the ugly box in the middle. :)
there are many things I would buy on ebay but dont because of
exhorbitant shipping charges. many use that to pad their profits and I
do not agree with that.

Again I am sorry, I will start looking closer.

..... I got *some* questions ;-)

As you mighty allready read, I got no Atari 8-bit before, so if any of my questions are dumb, please forgive me :-D

Iï¿½m now nearly complete, I just built a SIO2PC Interface (internal) into my 600XL and upgraded to 64KB before ....

Then I downloaded APE and all works fine .... but some things are on my mind :

1.) Which is the best DOS to use and why ??? (I just used SpartaDOS which came with APE)
2.) How can I access a floppy drive from Basic ???
3.) I got my 600XL attached to a TV, either I get a B/W screen or blurry colors but no sharp and clean picture, I allready rejusted the TV Modulator but no success, what to do ???
4.) I wanted to play ULTIMA 1, I got the PRG and PLAYER Disk Image ! After Boot I have to choose the Number of Drives and if I want to continue or start a new game .... all this with numbers (0 to 2) .... nothing happens when pressing them ???
5.) Most of the time, after playing a game, I have to restart APE cause it wonï¿½t work anymore after changing Images, why ???
6.) I just played M.U.L.E, Archon I + II and Arena, could you suggest any really good games ???
7.) Next thing I want to built is a MyIDE Interface, I allready got the parts for it .... any other Hardware things I could build to expand my 600XL ???

Ok, thatï¿½s all for now ;-) Iï¿½m off playing M.U.L.E now .... greets from Germany ...

RetroMan (proud owner of a 600XL/64KB/Sio2PC !!!)

I like DOS 2.5 and Top Dos myself. MyDos is okay too.

> 2.) How can I access a floppy drive from Basic ???
What do you want to do ? DOS <RETURN> takes you to the DOS menu, if DUP.SYS
is on disk. Else you can :
CLOSE #1:OPEN #1,6,0,"D:*.*"::FOR I=1 to 1e9:GET 1,A:PRINT CHR$(A);:NEXT I
(At least that is what I think it is to get a directory)

> 3.) I got my 600XL attached to a TV, either I get a B/W screen or
> blurry colors but no sharp and clean picture, I allready rejusted the
> TV Modulator but no success, what to do ???
Tricky. Is that a PAL machine, not a SECAM or anything ? Try another cable
maybe.

> 4.) I wanted to play ULTIMA 1, I got the PRG and PLAYER Disk Image !
> After Boot I have to choose the Number of Drives and if I want to
> continue or start a new game .... all this with numbers (0 to 2) ....

Maybe try the translator disk first. My Ultima I didn't work on my 130XE
without it.

> 5.) Most of the time, after playing a game, I have to restart APE
> cause it won�t work anymore after changing Images, why ???
On the PC side ? Weird things happen under Windows, but I never experienced
it with DOS.

> 6.) I just played M.U.L.E, Archon I + II and Arena, could you suggest
> any really good games ???
Drop Zone, Bounty Bob Strikes Back, Ballblazer, Rescue on Fractalus, The
Eidolon, Whistlers Brother, Stealth, Spelunker, Cavernia, Miner 2049'er,
Alternate Reality, Drol, Bristles, Flip and Flop, Warhawk and a heck of a
lot of others.

> 7.) Next thing I want to built is a MyIDE Interface, I allready got

RetroMan <retroman@bluemail.ch> wrote:
> 1.) Which is the best DOS to use and why ??? (I just used SpartaDOS
> which came with APE)

Most people 'round these parts seem to prefer SpartaDOS.
Personally, I'm a BASIC junkie, so I fell in love with TurboBASIC XL.
Since the typical disk-based SpartaDOS takes over the memory under ROM,
TBXL conflicts, and therefore doesn't work.

So, I stuck with Atari DOS style DOSes. My favorite was MyDOS.
It had a nice Atari DOS style menu (but better), supported 8 drives and
a RAMdisk (you could set it as drive 9). It had some advanced filesystem
features like subdirectories.

I think if you didn't do anything funny (like subdirs), the disks could be
read w/o any problems under other DOSes (like Atari DOS 2.0, 2.5, etc.)

> 2.) How can I access a floppy drive from Basic ???

```
10 OPEN #1,4,0,"D:FILENAME.XYZ"
20 INPUT #1,A$
20 PRINT A$
30 CLOSE #1
```

... for example. :^)

<snip>
> 4.) I wanted to play ULTIMA 1, I got the PRG and PLAYER Disk Image !
> After Boot I have to choose the Number of Drives and if I want to
> continue or start a new game .... all this with numbers (0 to 2) ....
> nothing happens when pressing them ???

Sometimes it's not obvious what you need to do. (This is why printed
instructions are helpful :^))

I'm not familiar with Ultima (played a little Exdous on an Apple II in
my middle school once :^)), but have you tried SELECT, OPTION or a joystick?

> 5.) Most of the time, after playing a game, I have to restart APE
> cause it woni¿½t work anymore after changing Images, why ???

I never had a problem. :^/ I ran APE under MSDOS 6.22, though. :^)

> 6.) I just played M.U.L.E, Archon I + II and Arena, could you suggest
> any really good games ???

Yes. :^)

Some of my favs, off the top of my head, include some really nice
freeware and shareware titles, like:

"Line Up" (a puzzle game by a fellow in Chile),
"Atartris" and "Valgus" (a Tetris game and a 4-way-Tetris game)
"Megablast" (forget who it was by! distrib'd by Dean Garraghty)

And commercial titles you should go find and purchase:

"BallBlazer" (aka BallBlaster - by Lucasfilm),
"Draconus" and "Zybex" (gorgeous, Amiga-style games by Zepplin Games)

I'd go to Groups.Google.com and do a search on comp.sys.atari.8bit
to find the occasional threads on "best games" :^)

Good luck!

-bill!

I have a similar problem, that I have to restart APE if I've rebooted the Atari more than once of twice duing a session. I'm runnin under XP - what about you? I'm probably going to try the DOS version of APE in DOS 6.22 and see what happens.

oh i'm sure it is..it looks like one of those monstrous old IBM
typewriters minus the paper feed...which is why i've always liked
them.

Could it be used as a good programming educator as well? I've never
been proficient in BASIC and being that I'm using computer all the
damn time I may as well become literate in its languages

Hi there,
I too met a few people years ago who got a TNC and used them for amateur packet radio. Some others built interfaces for the joystick ports, with their digital (joystick) and analog input (paddle) pins, used them for data acquisition devices. Hofacker (a german publisher) even did a book called "hacker book" which included a few devices one could build for the 800 with the programs to go with them.

There's a special place for the 800 in my heart.
It is a neat computer.
I'm afraid I don't use one, tho. I wished that a super
video upgrade had been made for it.
They lack a PBI or ECP port, so no MIO or BB,
they don't have RAM under the OS, so no SpartaDOS,
at least not the 3.x disk versions.
People say they get excellent video out of a stock one,
but my two give the poorest stock video of the 8-bits.
I think the best stock video is a 130XE.
I think the ATR8000 plugged into the joyport, so you
could have a hard drive from an 800. And there are
lots of memory upgrades for them.
They were the first, and best built, of all.
They were modular, and socketed thruout. It is easy
to isolate, CPU board, memory boards, ROM board,
main board and all socketed, so even a duffer like me
can trace a problem by switching known good parts in.

FOLLOWUP: I tried the DOS version of APE, and I didn't run into this problem at all. Seems to be a bit more stable than the XP version, if slightly lighter in features.

My 800XL is where I learned to program (in BASIC). I guess the foundation
paid off, because 20 years later I make a pretty decent living at it!
Programming - not BASIC :)

Usually I would check A$ for " FRE" if you use DOS2.x but just catching the error will close the channel I think.Something like:

```
35 IF A$(4,7)=" FRE" THEN TRAP 4E4:GOTO 50
```

Close... just a few corrections, an extra colon before the FOR... and to should be TO and, lastly, you need a pound sign in front of the 1 in the GET part... GET #1,A... otherwise, I liked this quick and dirty directory. Just need to store it as a LISTed program and ENTER it when you want it, ie... QDIR.LST. Otherwise you have to hand-type this each time you want to use it which would be tedious. This won't be too useful, though, unless you have it on every disk that you have files on it... unless you have a ramdisk and have this util on it.

Happy 8-bitting!

That would mean that all printers as well as all webcams and all other stuff
all use a certain standard (well, one for printers, one for webcams, one
for.....)
Which would mean that if we have one printer driver or one webcam driver,
that all printers or all webcams should work with that driver.

Can somebody write me a nice driver for webcams and the USB cartridge
(developed by Guus Assmann. Check out:
http://www.strotmann.de/twiki/bin/view/APG/ProjUSBCart). :-)

the
> PC?

For disk images, ATRs are the most common, so try this (I hope this is
allowed here?)...

ftp://ftp.spudster.org/CTH/Games2/ATR/

DCMs seem to be the next one, so here you go...

ftp://ftp.spudster.org/CTH/Games2/DCM/

You may want to try the MegaImages too, they are loaded with games and
fairly easy to use, you just need to get a menu program and attach it to
drive 1 and then attach one of the images to drive 2. They are the ones
that are games001-games020.zip. I don't know what the other ones are that
are in that directory but they are not really mega because they are only
enhanced density or double density. Most of the Yogi megas are around 800K
in size which is way beyond the range of any normal disk drive, hence Mega.
So you can only load these in an emulator. The other ones in that directory
look like they can be loaded on a 1050 or a drive, like Indus?, that can
read true double density, 90k x 2... I think a Happy 1050 or US Doubler,
etc, can? 90k, btw, is single density and that is only format that an 810
drive can do... unless there is a mod I don't know about? I don't even
think, if I remember right, that an Happy 810 can? Anyways, forget my
babbling, here you go...

ftp://ftp.spudster.org/CTH/Games2/Megaimages/a/

Enjoy!!!

PS Yeah, your best bet would be to build or get an SIO2PC and its software.
I don't know exactly where to steer you on this... I think someone else
already has. Anyways, the SIO2PC, I think, is the quickest and easiest way
to get access to your software on the PC to where you can transfer your
files or whole disks to the PC and then make images of them to run in the
emulator. Another, good and popular one is APE, but I don't really know
much about it, except for being powerful, it probably really isn't as
user-friendly as the SIO2PC setup may be, but that's just my opinion. But,
in the meantime, most of what you have can probably be found at the above
sites... really!!

Happy 8-bitting!

USB cartridge? You are talking about using a Are you talking about a PC with on-board USB ports.. or did you have to add a card, etc, to get USB ports?

Someone else can correct me on this, if I am wrong. Anyways, supposedly, USB devices are just plugged in and ready to use. So, that makes you think, the only drivers needed is/are the ones that control the USB port. But I got a cable modem recently and plugged it in via USB but still had to load drivers for it... so that seemed to defeat the purpose of a USB port to begin with... just plug in and use... no loading extra drivers, etc. There might be generic drivers for most of the stuff you plug in via USB, but there is always exceptions, of course!

About drivers in general... there are two kinds, general and specific. W*ndoz is packed with general drivers and will usually use them if there is no specific driver for the device you are installing. Most products, though, usually will come with their own drivers so you need to load them instead at the time it asks for them and don't let W*ndoz install the generic driver or even the specific driver that it may have for that product as it may be outdated depending on what W*ndoz version you are using. So, bottom line, most of the time, use the drivers that may come with a product.

Happy 8-bitting!

Well, none of the Atari OS's (not even special OS's) and none of the DOSses
for the Atari 8 bit (not even MyDOS) have code in them that supports USB.
And my Atari's (all 7 of them) don't have USB ports either.

So I need Guus' interface. (a small PCB that fits inside a cartridge case
and has two USB ports)
And a programmer that can write me some USB code that'll make my computer
(XE) talk to my WebCam (which has been ordered by the shop this morning.
Ofcourse, I was there yesterday and they didn't know they were comming. But
the service guy at http://www.sweex.com told me about the order. 15 Euro's
(15 US Dollars) for a webcam isn't to much. (OK, so I have to focus
manually. And there is probably no mike build in. But mikes can be had for
a couple a bucks nowadays.))

CU Mathy van Nisselroy

PS just so you folks understand what I am talking about. This is a USB
cartridge that will plug into your cartridge slot on your 400/800/XL/XE and
will give your computer TWO USB ports.

> conversation piece?

That is a hard question to answer for you, as it really depends on what you want it to do for you.

Yes, it is small and old and out-of-date, but they are one of the best built computers of that era! They are highly dependable and reliable. You can leave one running for 24hrs a day for years without failure! Hmmm... now I am interested in knowing how long they really can run! So, especially you old-time bbs operators... what is the longest time you had one running? Anyways, as I said before and know, these are highly dependable and reliable computers. You can do lots of things with it, besides the couple you mentioned. You can use it as a security setup, appliance/lights controller, etc. Anything that you can control by infrared device can be connected and put under the control of the Atari!

I knew this one guy who made or set-up highly precisioned devices under the control of an Atari with, according to him, complete perfection (or the error rate is so high that it is beyond the chance of failure, except related to power source, of course). I never really saw it in action, though. I did see some kind of saw/cutter that was attached to an Atari. He was/is an electronic tech, of course, with a high degree of training and knowledge... well, maybe related to Atari, anyways, because I took another old kind of computer, Kaypro, that I acquired to him to be fixed but he could never get it fixed. I took it to him 2-3 times! Oh well, on with the point of my message... bottom line, again, is up to you on how you want to use an Atari or what you expect from one. Yes, they certainly are not anywhere near the capabilities of a PC, but with knowledge and learning, an 8-bit can become pretty powerful and really pack a punch for a small time computer!

Best bet is to read the FAQs here and do searches (Google, of course) on the net to learn more about these old machines. Believe it or not, there is still a ton of information out there on these machines!

Happy 8-bitting!

Note: Some of the things I mentioned before really require an XL/XE machine as they allow, among other things, memory upgrades or hooking up other kinds of devices using the extra port that was freed up when 2 of the joystick ports, among other things, were removed when it went from 800 to 800XL. So, therefore, they are a bit more powerful than it's parent... 400/800.

I second that, although I started with a dinky Vic 20... only 3k of memory!

If you want to learn programming, BASIC is a good language to start out with... kinda gives you the fundamentals of programming, although I am not really a programmer. I learned alot and taught myself BASIC so well that I aced and amazed a junior college professor when I had to take the course there. I could have just took the final or all the other tests and passed the course without stepping a foot into the classroom!

There probably is some BASIC tutorials around somewhere, I just don't know what to recommend to you. I already know the language so I did not even need any tutorials when I moved over to the 8-bit.

As I mentioned before, the 8-bits can be used for *ALOT* of things! You might be surprised, and even myself too, at what is has been or is being used for! Since it is pretty durable and hard to do damage to one, unless you are purposely doing it, it is a great starter computer for young children. There are many educational programs out there and there are some really good business applications for it too. Syn series (SynCalc, SynFiler, etc) is probably one of them.. I don't really know since I haven't used it myself. With specialized software and memory and other upgrades, you can use it to run a small business and do just about anything you need to do! If needed, they can even be networked too! I don't really have any experiences to share in this area, but maybe somebody else does.

Happy 8-bitting!

BASIC was designed as a teaching language, IIRC, but it's not a very "hot"
language today. IMHO, better to learn programming on a more powerful
system using a more common language, especially if your goal is to build
up some marketable skills. If it's just for your own personal hobbyist
use, then BASIC is OK, although you might want to look into one of the
expanded BASICs, like BASIC XL. If you really must use an Atari 8-bit to
learn a more popular language, I'm pretty sure there are one or two
stripped-down C compilers available for it.

Here's a site with software and instructions on building them.

http://www.tcainternet.com/wa5bdu/sio2pc.htm

If you're not into hardware modifications and/or don't want to track down
all the parts you'd need, there's a guy who sells them on eBay on a
regular basis. Here's his latest auction:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2082311796

I ordered one from him and it arrived promptly (despite coming from Europe
to the US) and works great.

> He runs a business..I think that's a real job....And you?

When he's begging for business I can only assume that he isn't real busy and
I don't consider selling a few bits and pieces online real work. I've done
that for a couple of years and didn't call it a job, because I did it in my
spare time after coming home from my real job.

Where the hell can you buy a new Atari? Atari's computer division has been
dead for years and market share has shrunk to virtually nothing.

Could be - I booted straight to DOS 6.22, and I have yet to see an issue.
Looks like I've found a use for an old machine in the spare parts closet!

I'm curious to know why it is a concern of so many people what Ben does
with his time or how he earns a living? Is he hurting your family
financially or physically? Is he forcing you to buy Atari stuff?

Why not just leave the guy alone? If you don't like the way he does
business, just don't buy from him. It's as simple as that.

So because you didn't make any cash out it enough to call it 'a job'
then you have the right to suggest someone 'get a real job'. The
definition of a job is that which through work provides the income to
survive, I think Ben and the other retailers feel that they have valid
'jobs'.

Ben's promotions are often coming from a different slant, no they are
not to everyones taste but at the end of the day ALL ADVERTS are
Begging for business.

Which does not answer the question, if anything it makes the original
question more obvious.

Why are you in a group / community that you feel is both dead and
people are wasting their time in...Surely it's also a waste of your
time being in here if you feel it such a dead donkey.

Sorry, I just don't understand the knocking of ANY retailer in such a specialist market, if you just don't like the mans adverts then say so but don't spite the mans efforts to make a living.

That doesn't necessarily mean dead. Severely depleted, sure. On the brink,
ok. But not quite dead yet.

>> He runs a business..I think that's a real job....And you?

Perhaps he has other sources of income that are inflexible and not filling
his financial requirements and is trying to boost it through his Atari
sales, or is not in a position to able to do any other kind of work (which
from his previous posts is in some ways true). Yeah, he might expand
business by selling PC stuff, too. In fact, a lot of PC things can be used
on newer Atari's (hard drives, monitors, CD-ROM/R/RW drives, etc.). That's
his choice. But telling someone to get a "real job" without knowing their
situation is just plain stupid and rude. It's like telling someone on
welfare, "Get a life," when you don't know what circumstances have put the
person where they are.

Try getting a Milan or Hades. Wait until the new Coldfire Atari clone comes
out. Upgrade your existing Atari (if you have one) with a graphics card or
CPU replacement (like the soon to be released CT60). Just because an
originating company has disappeared doesn't mean the platform itself is
dead.

Hello Steve,
Hello Mathy,

unfortunatly the USB Standard didn't support platform independet drivers, though it is possible. Some OpenFirmware Machines (SUN Sparc, Apple PPC, IBM PPC...) have architecture independent drivers written in FORTH.

For USB, to my knowledge you need driver for the USB Controller, and for each device. Similar devices should be usable with the same driver, but as we know in the PC area most vendors didn't care so much about standards. I think the best chance to get universal devices is to look for devices that support at least three palarforms (windows, MacOS 9/X, Linux/xBSD). If this is the case, we have at least some source code to look into.

There are also two kind of USB controllers, low-level and high-level. With low-level controller, the software (the driver) has to do much of the work)bus protocol), with high-level controllers, the controller has much more function. The software can use high-level function (send this string to that device).

I have to figure out if the controller Guus is using is a high- or low-level one.

Regards

Carsten

I'm not the person with the 2600 for auction, and so I don't know if this
is the method used, but the Atari Age 2600 FAQ has some information on
doing this with 2600A and 2600Jr systems:

http://www.atariage.com/2600/faq/index.html?SystemID=2600#composite

A couple of questions down, there are links to another couple of sites
with instructions:

http://www.classicgaming.com/vcsp/HowToMAIN.htm (two links, one for
4-switch and one for 6-switch units)
http://www.hwcn.org/~ad329/2600vidm.htm

A Web search might turn up other sites with instructions, too.

Unfortunately, many older BASICs, including Atari's, rely heavily upon
GOTO for program flow control. This is evil. Most languages in widespread
use today, even including many more modern BASIC interpretations from what
I understand, rely upon functions (aka subroutines, procedures, etc.) for
program flow control. The problem with GOTO is that it lends itself to
bizarre and twisted execution strings rather than grouping code in groups
of commands that perform logically integrated tasks. Taken to an extreme,
GOTO produces something that's called "spaghetti code" because it can be
so hard to follow, like strands of spaghetti on a plate, all intertwined.
I recall one program that was published in an Atari magazine in the 80s
that was so hard to follow that I abandoned any attempt to tweak it to do
what I wanted and wrote a new program from scratch.

IIRC, BASIC XL (an expanded version of Atari BASIC sold on cartridge by
OSS) included some sort of function or procedure implementation, and so
wasn't nearly as reliant upon GOTO. IMHO, it's better to learn to program
without using GOTO.

>that all printers or all webcams should work with that driver.

What you are talking about is class drivers. There are "classes" of devices that most operating systems have drivers for. ex. "Mass Storage" I believe that the device has to let the host know (through the config specs) whether it supports certain class drivers or not. Some devices support more than one class device in the same unit and these may be addressed by the computer as seperate entities.

>Can somebody write me a nice driver for webcams and the USB cartridge
>(developed by Guus Assmann. Check out:
>http://www.strotmann.de/twiki/bin/view/APG/ProjUSBCart). :-)

Can you use the National Semiconductor chip as a host controller? I couldn't tell from looking at the spec sheets for it. Natsemi calls it a "Node controller" and I wonder if it can even be used in the way that you want.

I don't think you will be able to easily use the cartridge as both a Host and a Node device (the SIO2USB project is a node device.)

I haven't looked into developing drivers for a host controller, but I imagine it will be a lot of work, plus you would have to develop drivers for each "class" of device you were going to support.

Hi James,

Do you know I'm not sure, but it's a pretty good game though. I think
it most probably was a commercial release. Also I've been told by
Andeas that there is 2 different types of this game available.

Regards,

Michael

Well, I will give you my answers and try to make them brief...

> 1.) Which is the best DOS to use and why ??? (I just used SpartaDOS
> which came with APE)

For first-time users, MyDOS would probably be better since it has a menu and puts everything at your fingertips. But if you are a seasoned MSDOS user, then you'll feel at home with SpartaDOS. It really is a matter of preference for each individual. Just try them out until you find one you like, but if I were you, I would stick with either MyDOS or SpartaDOS because either of these will work with 16 meg partitions. I guess that, from what I have seen here, TopDOS Professional does too, but you still be better off probably by sticking with one of the above.

> 2.) How can I access a floppy drive from Basic ???

There are many ways to access the disk drive from BASIC. BASIC as built-in commands for SAVEing or LOADing a file to and from the disk drive. SAVE stores the file on disk and LOAD retrieves the file from disk. There is also a LIST (save) and ENTER (load) command that also stores or retrieves files from the disk but in a different format than SAVE and LOAD. SAVE and LOAD uses tokenized (codes for commands and other crunching techniques) files. LIST and ENTER uses a raw listing of the program. So if you examined one, you would see all the lines of your program that you entered followed by the Atari return key which is different than the PC, but if you translated it to PC then it would look exactly like a LISTed file of your program you typed in. There are other BASIC commands that deal with data files such as OPEN/CLOSE, GET, PUT, INPUT, etc, but these are a bit more complicated to go into right here. Then there is a command called XIO and there is several functions that can be performed by this command, such as deleting a file, renaming a file, formatting a new disk, etc. So that pretty much covers how you can access your disk from BASIC. If you know or learn machine language, you can also write your own routines to access the disk.. but there are plenty of programs out there that already have routines in them that you might be able to extract them and use them in your own programs. Well, I will leave it at that. Oh, by the way, here is the corrected BASIC program for a disk directory...

```
10 DIM A$(20):TRAP 60
20 TRAP 70
30 OPEN #1,6,0,"D:*.*"
40 INPUT #1,A$
50 PRINT A$
60 GOTO 40
70 END
```

On to the next question....

> 3.) I got my 600XL attached to a TV, either I get a B/W screen or
> blurry colors but no sharp and clean picture, I allready rejusted the
> TV Modulator but no success, what to do ???

May be a bad cable or RF box in the computer? Try using a cable from the din (marked Video, I think) of the computer to a monitor or your TV. What kind(s) of input do you have on your TV? If you have audio/video, then you can easily get a cable that will plug into the din of the computer and then into the audio/video of the TV. If you have coaxial on the TV, then you'll probably have to put a cable together, that will allow you to plug into the RF port of the computer and then screw into the coaxial. There are 2 ways of doing this... 1) Using a coaxial cable and finding an RCA adapter that will attach to one side of the cable and plugging into the RF port of the computer and then attaching the other end to the TV. 2) Finding an RCA jack that you can solder to one end of the cable, cutting the coaxial one off, of course. I have used the latter kind of cable and it has worked pretty good for me. The monitor type cable, of course, would be better. That's it for this question.

> 4.) I wanted to play ULTIMA 1, I got the PRG and PLAYER Disk Image !
> After Boot I have to choose the Number of Drives and if I want to
> continue or start a new game .... all this with numbers (0 to 2) ....
> nothing happens when pressing them ???

Since you are using APE and SIO2PC, that is not in my realm of experience. But from a little experience and from what I have seen, I can think of a couple possibilities here. 1) The images might be protected and therefore the program won't run because of this... un-protect the images and see if that works. 2) Are they PRO images... ie. ULTIMA.PRO... if so, then I think there may be a setting, called Mode, you have to set once you attach the image. I don't know what version you have, but mine has about 11. It's the number after the density which, by default, 0 for no drive emulation. You might have to fiddle with this to get it to work. That's all I know about this. Forgive me if you already know or tried these.

> 5.) Most of the time, after playing a game, I have to restart APE
> cause it won't work anymore after changing Images, why ???

All, I can think of here is whether you are turning off the computer each time you switch and try to load a new image. Ataris are cranky about this so I was wondering if you were doing that. Simply hitting reset will not work most of the time.

> 6.) I just played M.U.L.E, Archon I + II and Arena, could you suggest
> any really good games ???

There are tons of good games!! Just got to go and hunt them down! :-) Such as Jumpman, Jumpman Jr, Great American Road Race, Racing Destruction Set, BC's Quest for Tires, Ghostbusters, Master of the Lamps, Bruce Lee, Seven Cities of Gold, Conan, Lode Runner, Boulderdash, David's Midnight Magic, Gauntlet, Spelunker and tons of others! Bunch of EXE files!! Look elsewhere in this sig to find links to get some of these if you don't

already know where to get them. Here is the main link for you which you can go from there.... ftp.spudster.org/CTH/

> 7.) Next thing I want to built is a MyIDE Interface, I allready got
> the parts for it .... any other Hardware things I could build to
> expand my 600XL ???

Depends on what you want to do with it. Memory (ramdisk) upgrade probably should be at the top of the list. They range anywhere from 256k to 4megs... so take your pick! Problem is doing it yourself, if you are not a techie, or finding someone who will do it for you... maybe Technoid Mutant would. There are some awesome OS mods, but most of them are more for a techie kind of person. I don't know if one of these would really be necessary for an average user. Then there are video mods, however, I don't know how you could really improve on the video, except for the sharpness aspect, and then there is the sound mods, a double Pokey for stereo effects. There probably is several others too. As you might know already... Germany, Netherlands and some other countries have some very interesting mods too.

Most of this stuff you can find or read about on the internet... just go surfing. I recommend using Google to do searching on whatever topic you want info on. Just start by simple searches such as Atari, Atari 8-bit, etc, and try all the links in the webpages that you may go to. Alot of these links may be dead now, but there are quite a few valuable links still around! Happy Hunting!!

> Ok, that's all for now ;-) I'm off playing M.U.L.E now .... greets

open #1,6,0,"d:*.*":for i from 0 to 1 step 0:input #1,a$:print a$:next i

is a good bit faster. I don't recall if Atari Basic provides and
eof() function, which could be used to limit the iteration of the for
loop, thus exiting the loop when the listing is done and closing the
handle.

Just so you know, you can get a brand new sealed trakball from b&c computervisions for $10 + about $8 shipping.

I ordered two, I use one, which works flawlessly with missile command, and I have the other new sealed one stored away for the future. I wish I could find a way to use it on the PC.

I don't think there is a TRAP for immediate mode, is there? Something like
TRAP 65536 or 99999 would have been a nice addition so you could use this in
immediate mode and eliminate errors from popping up. Not that you would
want to use immediate mode that much but sometimes it's good for a quickie
or for automating things using this mode and this would eliminate error
messages from showing up and creating panic for a newbie. Oh well,
all-in-all, Atari BASIC was cool! Except it did have some strange quirks
and made it difficult for porting programs.

Major correction here... programmers relied heavily on GOTO in their programs... BUT Atari and Commodore, and others of that same era, *DO* have GOSUB which makes it possible to make subroutines and you don't have to rely that heavily on GOTO then.

Great screenshots! That's a real find, a real blast from the past to pull out of someones dark, dusty attic! The reversed slashes make the images rather difficult to download but I was able to get them with WGET.

> stripped-down C compilers available for it.

Yeah, BASIC is not the language of the day but he's using an Atari! So BASIC is the native language of that machine. I think it would be better, if he is going to learn programming, that he starts off with BASIC. It won't kill him to learn it. It's a fairly easy language which you can learn in almost no time at all. If you program right, it does teach you the basic fundamentals of programming... such as variables, subroutines, etc. Then if he wants to dabble further, then he can check out other languages that are available for the 8-bit such as Pascal and Fortran but, since I am not a programmer, I don't know if it would really be wise or worth the time to learn these, especially on the 8-bit. Action probably wouldn't hurt since I think that has some resemblances to C? I don't know if he plans on programming for a career anyways, but I sense probably not so sticking with BASIC (maybe TurboBASIC would be better) and Action would be good enough for him. But it's up to him, anyways, of what he wants to do.

That's what most people fail to realize, the Atari800 was my first computer
and I really digged Atari Basic, went crazy when I got the disk drive and
dived headlong into Assembler and wrote my first published game Dimension
Wizards in Vol.7 Issue7 of Antic. You just can't replace these machines,
they were fun way back then and they are still fun today. I get a real kick
out of optimizing 6502 ML routines for use in Atari Basic to help make game
programming tasks easier. I pity the kids today who grow up playing that
Grand theft Auto bullcrap with beating civilians in the street with a
baseball bat and all that violent stuff. Gimme star raiders or pengo or
qbert or defender any day of the week. I recenty started a 5200 collection.
I like the 5200 alot. I got an Xbox and a gamecube and a dreamcast too, and
lots of PC games, but these new kids on the block will never begin to
appreciate the technology we have today the way we do.

I just don't like the way he begs for business. If he is that hard up he
should expand into other markets to prop up the Atari side of his
business... It was just a suggestion, and a good one IMO.

And Atari is dead, the computer division that is, not the legacy hardware
which is obviously still being used or no-one would be here.

Ah, yes, I'd forgotten about GOSUB. It does help, although it's sadly
underutilized.

7486. Multiple disk images on one physical disk?

Newsgroup: comp.sys.atari.8bit

Hi,

I've checked a couple of FAQs, but can't seem to find this issue addressed. I've got several disk images, most of which are only a few KB in size. I'd like to be able to put several of these on one physical disk for use with a real Atari 800XL. (Using SIO2PC is possible, but awkward, since I've got to schlep my notebook upstairs to the 800XL to use it.) Is there a utility that'll convert a bootable disk or disk image to a file that can be run from a DOS? Thanks.

A business person would come to realize that his market isn't significant
enough to make a living from it anymore. I simply argue that the way to
resolve this problem is to diversify, and not beg.

TRAP works fine in either mode, but references a line number that must be in
the statement table which negates its usefulness. I just always expect the
error 136 and follow it with an END command and there is no real harm. I
avoid the need to DIMension strings along the path of least typing and
prefer:
CL#1:O.#1,6,0,"D:*.*":F.L=1TO999:GET#1,B:?CHR$(B);:N.L

The TRAP in line 20 makes little sense following one in line 10; perhaps
placing the one in line 10 before the DIM statement and setting it directly
for line 30 in the event A$ exists or preferably a CLR before the DIM and
then addressing the case that channel #1 is currently open.

BTW, most US 600XLs did not have the DIN monitor jack.

There are some utilities for conversion of boot programs into binary Dos
load files; many single boots will transfer.

There also were some boot manager utilities which created a new boot disk
containing a loader for your boot programs which could be installed on the
disk. I know Compute! printed one of these mid '80s. I don't specifically
remember if Antic or Analog published anything similar.

Oops! The one in line 10 should have been deleted. Technically speaking...
the TRAP should be the first line of the program, just in case there is an
error with the DIM. But setting it to line 30??? I don't think so! What
if there is no disk in the drive or there is a problem with the disk... it
would be stuck in infinity then and the user may not know what it's doing or
what is going on then.

> BTW, most US 600XLs did not have the DIN monitor jack.

Oops, again... I forgot about that! Well, put one in then! LOL I think
you can do that. I think the printed circuit is there for it since it's
almost exactly like an 800XL board! Maybe there's some other adjustments
that need to be done. I am not an expert on it, but I think it can be done,
though.

Thanks for the corrections... I will try to be more careful next time! :-)

FWIW, I recently came across a modern update on Breakout for X (Linux,
BSD, etc.), called LBreakout
(http://lgames.sourceforge.net/index.php?project=LBreakout). It's very
nice -- lots of different screens, much better sound, etc. Still, there's
a certain appeal to the original Atari bright candy colors and simple
"beep-boop" sounds. ;-)

Oh, there's also an Archon for X, called XArchon
(http://xarchon.seul.org).

>if he is going to learn programming, that he starts off with BASIC.

I don't program anything in BASIC, but it is nice to be able to test things out, or write a quick and dirty program to do some simple thing.

I would take a look at cc65 (http://www.cc65.org) which is a cross compiler for most 6502 based machines. The atari library works very well and is being constantly updated. The boys over at the cc65 mailing list are very knowledgeable and seem very willing to help. Of course, I like C so I'm very biased.

On Sat, 21 Dec 2002 at 23:48:00 +0800, "Clockmeister" (gerryvdb
att tnet dott com dott au) scribbled:
->I just don't like the way he begs for business. If he is that
->hard up he should expand into other markets to prop up the Atari
->side of his business... It was just a suggestion, and a good one
->IMO.

First off, I have to grant that your postings have been more responsible than those of the troublemakers who recently were plaguing this base.

However, the dealer you refer to is involved in business in the U.S.A., where the official religion is Capitalism with a capital C and a capital ISM. <grin> There's an old saying that "The business of America is business." In this country everybody has the right to engage in business, and they're free to ignore "advice" from others as to what business to be in, what lines of products they should carry, how to run their business, and so on.

The last I heard, the federal tax rules are that if a business makes a profit in three years out of five, then it's a "business." If it doesn't, then it's a hobby. (Unless, of course, it loses BILLIONS of dollars, in which case it's a valuable public charity, and Alan Greenspan and whoever the Secretary of the Treasury is for this week will rush to fork over tons of tax dollars to that business so that the overpaid CEOs will be able to maintain their mansions and yachts in the Bahamas and so that the underpaid peons making minimum wage at the bottom of the food chain will be able to hold on to their 70-hours-a-week jobs.)

You apparently missed Ben's long posting some weeks ago where he detailed his personal situation and reasons for dealing in Atari stuff. There's really no need for him to have to post such justifications. He has the right to be in business; how successful he is in that business is his concern. Other people's two-cents-worths about how Ben should run his business are worth just that. (BTW, in America nowadays, two cents isn't worth anything! <grin>)

As for begging, by your standards every business in the U.S.A. is "begging" for business. We're inundated with signs, advertising, commercials, etc., etc. Your opinion seems to be out of step with the reality of the American marketplace. When compared to what's going on out there in the real world, the notices posted here by the few remaining Atari vendors are very mild stuff.

->And Atari [Company] is dead, the computer division that is, ...

I think that's generally known by now. There's no need to harp
on it.

->... not the legacy hardware which is obviously still being used or
->no-one would be here.

"Here" being this Usenet newsgroup, which for all practical
purposes is presumably the only completely open, freely available,
organized community of and for Atari 8-bitters. This is where the
few remaining Atari 8-bit dealers belong, and this is where they
should be posting. But yet, a small cadre of hard-core objectors
and resisters has so intimidated those dealers that one of them
recently posted here, "There are only four of us left and we're
afraid to post here." This is unfortunate. What's left of the
Atari 8-bit community will be worse off if those dealers are driven
out of business or driven off this newgroup for the sake of "purity"
as defined by netcop ideologues or anti-capitalist, self-styled
reformers.

I've seen the same sort of thing happen on other newsgroups:
The ruckus raised by the netcops is almost always much worse than
the original postings. (On the other hand, the irresponsible
postings by troublemakers -- the so-called "trolls" -- are
unacceptable and must be strongly opposed by the responsible
Usenet community.)

The grammatical construction of this reply suggests that this reply originated from some kind of string generator/random reply parser. I wonder is Sinclap isn't actually a lonely computer just trawling news groups spooling out its dribble, i suppose it could also be the work of the fabled infinite number of monkeys taking time of from the complete works of Shakespeare...

Ben is almost as brain damaged as Sinclap, maybe they share a similar head injury.

Hi,

> What ATARI printer was capable of printing the
> graphic character set?

Are you specifically refering to printers sold under the
brand name Atari or is this a more general question?

As for the later: There was an extended interface box called
the 850XL that managed to print these special characters on
any printer that understands the Epson EscP sequences.

So long,
Thomas

7508. Re: Atari Christmas/Holidays Sale!

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-21 21:17:01 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>

Source record: 24727

When "Bravo Sierra Computers" (atari att aracnet dott com)
scribbled:
->>> Got Atari Questions?

....Paul Gifford (giffy1 att comcast dott net) replied:
->>I have a question. Why do you continue to denigrate atari
->>auction sellers, many of whom frequent this group?

....to which on Fri, 13 Dec 2002 at 00:04:46 -0600, "Sean
Connery" at munged address chimed in with:
->Because he thinks we're dead horses to be beaten at his whimsy?

Well, no. Try this one out for size: Because he has an antique
opinion about the online auction scene -- an opinion he's been con-
sistently stating all along -- which is apparently based on a skepti-
cal attitude about the degree of honesty, reliability, and quality
to be found in the marketplace for used goods, especially when offer-
ed for sale by individuals.

That is, he's saying "Caveat Emptor." (Which the dictionary says
is the buyer taking on all risk in a business transaction.) In other
words, don't trust the guy trying to sell you the Brooklyn Bridge.
Or don't hold your breath waiting for Herb Woodley to return Dagwood's
tools that he borrowed 55 years ago.

The bottom line is: Yeah, sure, his opinion is different from
that of the mainstream. And <sarcasm on> in America today we all
know that one must never have an independent or different opinion.
(Just ask Trent Lott on the Far Right or the protestors against the
inevitable U.S. war on Iraq on the Left.) This is America, where
if a person holds one bizarre opinion, then that person is tossed
onto the scrap heap of history, not to mention tarred and feathered
and run out of town on a rail. <sarcasm off> So Ben's opinion of
auctions is going to continue to be controversial, and the result
is he's going to continue to get all this free publicity on this
message base! As the comedian Yakov Smirnoff says, "What a
country!" <grin>

Source record: 24728

On Fri, 13 Dec 2002 at 03:44:01 -0500, "Technoid Mutant" at
munged address scribbled:
->Failures I can attest to are: ... Indus GT, ... Despite thier
->cool features, as disk controllers they suck.

I'd like to put in a good word for the Indus. There were
basically two kinds of Induses: (1) Those that broke down within
the first month or so; and (2) the rest, which tended to last
forever. At any rate, that's my experience.

When there was a company putting out the new product, they could
be counted on to replace bad ones under warranty if a new drive
broke down. That was in the Good Ol' Days of the '80s, of course.
Thus I can say I got my money's worth on all the new ones I ever
bought. They're still running, as are the "reliables" I got in buy-
outs in the '90s from Atarians who were dumping their 8-bits but who
had taken good care of their equipment. As for the "others," which
is to say, any *used* Induses I bought at computer shows, hamfests,
and such places, the story is Caveat Emptor City. (Or put more
bluntly, "Don't trust buying anything used.") You rolls the dice
and you takes your chances. I think what I've said before about
floppy disks also applies to disk drives: Cigarette smoke and dank
basements (and rough handling) are bad for them. If you're going to
buy used, try to find the proverbial little old lady with tennis
shoes who's switching from Atari to Windoze! (And who doesn't
smoke.)

He's been around forever, at least a decade that I can tell. People have ignored him / it en masse and still he comes around to put one foot in his mouth and the other in a spot even less appealing.

7512. Free Atari stuff + amber monitor for sale

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-22 01:41:46 UTC
From: esok_@hotmail.com
Message-ID: <8b7f0eec.0212211741.45ef6312@posting.google.com>
Source record: 24731

There is some old Atari 8-bit stuff at my parents' house for sale. I would like to find a good home for it. I will give it away for the cost of shipping. Here's what's available:

Atari XDM121 daisy-wheel printer. Worked the last time it was hooked up. Direct connection to the Atari serial bus; no printer interface needed. Comes with one partially used ribbon and power supply.

Star NX10 9-pin dot matrix printer. Worked the last time it was hooked up. This printer requires a printer interface such as the Atari 850 or the P:R: connection, or the like. I have an Ape Face printer interface somewhere; I will include it if I can find it. (This interface didn't have standard connectors, so it might need some working to get it to connect.) I also have about a half of a box of tractor-feed paper. Power supply is built into the printer.

Atari Speed Reading, 5-cassette set, with original manual and case.

Atari 1027 power supply and manual (no printer). This power supply is similar in size and shape to the other Atari power supplies, but its electrical qualities are slightly different. Only a 1027 may be safely powered with this brick.

I also have a smallish monochrome (amber-colored) monitor that works with any composite source. It comes with a cable to hook to the atari (5-pin DIN connector to 2-RCA). It worked the last time I hooked it up. $20 + shipping. I will entertain reasonable offers on this.

Please email me if you are interested in any of these items. I will ship between Dec. 28 and Jan. 4, when I am visiting my parents. (They live in Orem, Utah, if you want to come and pick it up.) I will ship to the United States only. I will probably be able to send/post pictures of these items when I get to Utah.

Somehow my memory had associated it with a game I saw on a bbs years ago that was written by the Peterborough subgroup of TAPS (Toronto Atari Programming Society). Speaking of TAPS, does anyone else remember that user group? unfortunately it closed before I decided what user group to join. Come to think of it if someone had their disk library it would be cool to re-release that on an ftp site or cd-rom perhaps.

> That is so true and so sad that games have come down to violence, being gory
> and sickening, etc. Where is there a game that *doesn't* have violence,
> etc, in it?? There is hardly any that doesn't have it!!! Then we wonder
> why kids are so bad and behave the way they do!
>

no kidding man. i heard the other day about how many women's groups
and media critics are pretty critical about some of these violent
games; it's kind of depressing that they will be popular anyway. One
of the company heads talked about the latest Xbox sleazefests not
meant for kids at all, but if you think about it, these people market
DIRECTLY towards that consumer group. same with chemical commercials,
you know, beer and tobacco things..they should be held accountable.

i especially hate the sexism in much of those games too. saw some ad
in Xbox magazine for ToeJam and Earl, one of the characters is an
alien girl and she shows some cleavage, a caption over them says
"sells games". i just snickered and was glad i wasn't the one paying
for that or i would cancel the monthly deliveries. someone else here
does and has little to say of such things...

i know i know it's supposed to be cute and funny but come on! i
thought we electroids were supposed to be PROGRESSIVE. kids and
younger adults see this sexism and violence on such a massive scale
daily and it's holding everyone back sociologically.

but we're getting off-topic here..oh yes i've been playing with
'Stella' lately. best Atari emulator I've messed around with. i
especially like 'Gorf', but my favorite to this day is
'Adventure'..ha...i just say the box cover of that old thing and the
actual game looks just as good as the cover :)

I guess I'm cheap, but that comes from the fact that when I was 8-bitting hardcore I had Zero money.

You can hack yourself a cart port using old-style IBM floppy drive cable (Card-edge) connectors. I know this sounds like I'm starting a theme, but it is accurate.

The card-edge connectors are 34? pin but have the same spacing as the 30? pin cart jack on the atari. Just mark for pin 1 and you'll know which side to plug the cart into. IN a pinch I'd do something like this:

Chop off four pins of an 5.25" to 3.5" floppy card-edge adapter. Solder into place on Mr. Atari's motherboard. This would leave a MALE card-edge in place of the presumably broken female card-edge connector. Connect Mr. old-style floppy cable to this and plug your Atari cart into the LAST connector on the floppy cable.

Sick huh? I know, but it works....

Regards,

jeff

Bravo Zulu Mr. Moeser!

I'd rather the group WITH a live vendor than a group without. Ben has been selling Atari gear since Christ was a seaman and its somehow comforting to see him still hawking.

Just wait til' someone needs something they can't get on ebay in time. Then we'll see whats what. Ben will still be there and probably wouldn't say a single word in kind to all that has been said to him. Notice he hasn't said a thing in his defence to date? Not that I'm aware of at any rate.

My opinion might be different if there were 600 or even 60 vendors hitting the list with ads on a regular basis, but that isn't the case and never will be. The leaves are few at the bottom of our cups even. Far from nagging him out of business, let's be grateful we have him at all.

Regards,

Jeff

Just a note to concerned parties, the 1027 adapter can be used to power nearly everything Atari short of the computer it's self (excepting the 1200xl which will like this adapter).

It is just a 9vac adapter with a bit more juice than a standard Atari 9v brick. This is really good for 'hopped up' Atari 1200xl machines or for general use.

Regards,

Jeff

7520. Cartridges, internal Roms, and the future:

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-22 04:41:27 UTC
From: Technoid Mutant <technoid@nospam.30below.nospam.com>
Message-ID: <sibN9.25274$C06.10983@news.bellsouth.net>
Source record: 24739

I see folks selling things such as cartridges these days and always wonder.

If you are a real die-hard Atari fan there are a few things you should know. One of the most important things is that EPROMS FADE. Eproms are the roms in most of your Atari computers and peripherals. Some carts have them as well in place of regular Roms. Even some roms that LOOK like regular roms (ie no 'window' on the chip) are eproms. There are two ways to know. 1) Check the part number against roms/eproms. 2) Try to 'burn' the rom with an eprom burner.

If I were forced to describe the difference, I'd say that ROM is a permanant form of storage whereas Eprom is Semi-permanant.

The gist of this is that Eproms die after an indeterminate number of years. A number of factors govern this but I won't bother you with those details. And, if you care about a device's function for the VERY long term, BACKUP that eprom. When it fades you can burn the data right back onto the original eprom. It isn't the rom that failed, it is that the data on it faded.

If pressed, I'd say an eprom SHOULD be reliable for 7 to 20 years. Some of you may have 'dead' floppy drives, computers, and/or other atari gear which sole problem is this. In that case, take an identical part out of a WORKING, identical device and try it out. If it works, have the rom duplicated. Viola!

So far as I'm aware, the other programmable integrated circuits (such as Pals and Gals) have no such fade, but maybe they do and none are old enough to exhibit it yet. The Atari MMU is a Pal if I recall correctly. Let us all Pray.......

Regards,

Jeff

7521. Re: I�m on my way now, BUT .....

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-22 04:58:20 UTC
From: Technoid Mutant <technoid@nospam.30below.nospam.com>
Message-ID: <kybN9.25373$C06.7907@news.bellsouth.net>
Source record: 24740

1) There are new dos's in developement, but Spartados is best. It is the most flexible and feature-rich dos.

2) There are several commands available in basic to access your floppy drive(s). Example:

If you want to load the file named "fuzzy.bas" into basic, you have two ways to do it:

the command RUN "D1:FUZZY.BAS"

or the command LOAD "D1:FUZZY.BAS"

The first will load and execute the program while the second will only load it for editing. To execute in the second example you would issue a separate RUN command after the file was finished loading and you have a READY prompt again.

3) There is a switch on the back of your XL to change the television channel. You have a choice of channels 2 or 3. Try each. If that does not work then your television, computer, or RF modulator is to blame. Another really nice way to get Clean video is to use a Composite Color Monitor and connect that to the 5pin din (Roundy) connector on the back of your XL.

4) Have your tried the SELECT or OPTION buttons to select the number of players? I have the game but haven't played it in 15 years at least. Email me and I'll boot it up and see what is going on.

5) Most Games for the Atari expect you to power the machine off after use. I'm not sure what you mean by Ape not working after loading one. Can you amplify your trouble report a little?

6) Oh Gosh. There are so many. I'm partial to a freeware dos executeable game called Gauntlet. No, it isn't the same as the arcade version which was also ported to the Atari. Mine is a horizontal scroller that is passingly similar to Defender.

7) Damn. Where did you get the board and programmed chips for the interface? You can also upgrade the memory on the machine. That is mostly for ramdisk storage, but why not?

999) If your 600xl has the 48k upgrade pack jacked onto the back of the computer, you MIGHT have trouble making the PBI version of myide work. I say MIGHT. If you are certain of your work, try the myide on someone else's 800xl or 130xe to make sure it is not at fault for any failure on your 600xl. If it isn't and you are sure it is your 600, then upgrade your 600xl INTERNALLY instead of using the external (1060?) upgrade adapter.

The PBI bus timeing is really-really-really tight. It is a freaking MIRACLE
that ICD got thier 256k and 1mb MIO adapters to work off of it.

7522. How to clean the head on your old Atari Floppy drive and other maintainence tips

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-22 05:20:13 UTC
From: Technoid Mutant <technoid@nospam.30below.nospam.com>
Message-ID: <PSbN9.25579$C06.14734@news.bellsouth.net>
Source record: 24741

If you have an old floppy drive you think needs a little TLC then follow me. These tips apply to ALL atari disk drives. Some few might have double-sided drives. If this is the case, then clean BOTH heads. Dig?

Open the case on your drive and remove the top cover. For Atari, Indus, and Rana, this is accomplised by removing the four screws on the bottom of the case. For Percom and ATR8000 by removing the screws from both sides of the case.

Your single-sided Atari disk drive has a read/write head that needs cleaning every few millennia. Some folks use a disk to do this, but since cleaning disks these days are double-sided, putting one in your single-sided Atari drive is a VERY BAD THING to do. I've adapted some cleaning disks by taping smooth material over the TOP read-write area, but it is better to do it this way.

Take a cotton swab (Cuetip or whatever) and some 90% pure rubbing alcohol. Wet the swab and scrub the head with it. The head is inderneath a swinging arm which holds a felt pad. While you are doing this, take a look at that felt pad. It bears down on the disk's upper surface under spring pressure to make sure the head makes good contact with the disk. THESE PADS WEAR OUT. Now you know why those cleaning disks can be a monster. They'll rip the darn pad off the drive.

If your pad is worn-out, you can pick it off the arm with a sharp blade and replace it. A simple, permanant replacement can be had by destroying an old cassette tape (Tape, not DRIVE). A cassette tape has the same kind of felt pad in it's center as your drive does. For the same purpose even. The tape's is rectangular but of similar size. Just pick it off and superglue it to your drive's arm. Bingo! Instant new pad. And you got a clean read-write head out of it to boot.

Symptoms of a worn pad are: A drive which powers up and appears normal but won't read/write or will do so unreliably. Of course these symptoms apply to a dirty head, broken pad-arm spring, misalignment etc, but a worn pad and/or dirty head are the culprits 99 times out of 100.

Another trick designed to quiet noisy drives is to take some lubricant, dampen a swab or paper towel with it, and run the damp material along the drive rails on which the head's carriage runs. This will both clean the rails and lubricate them. This doesn't really DO much, but it makes the drive purr which is cool. You have to do this every few months in order to keep it nice and quiet, but that give you the incentive to clean the head while you are in there.

Another installment of Tips from your favorite mutant!

Regards,

Jeff

My personal variation on the theme is to use
O.#1,7,0,"D:*.*":F.I=0TO256:GET#1,I:PUT #16,I:N.I

followed by an "END" command after the ERROR- 136 message appears.

Thinkingthinkingthinking...

Let's see... it works like a mouse, basically (an inverted mouse, that is),
so you'd have to make an adapter to connect it to the PC's serial port, or
isn't that what you're looking for? I mean, do you want to use it as a
replacement for your mouse, or just as an extra controller? If the latter,
then since the PC joystick port has provision for digital 4 switches, you
could make an adapter from 9-pin to 15-pin and wire the lines from the Atari
joystick connector's 4 directions to those 4 lines... Of course you'd need
an additional one for the trigger. Hmmm...

If I recall correctly, I have a utility for the ATR8000 that does this. The problem is that the user does not have an ATR8000. My uilility (I did not write it) uploads a progam to the ATR8000 computer which tells the disk controller how to handle these file partitions. It aint pretty, but it works.

As far as it goes, what I would do is tap a hole through my ceiling and run a LOOONG cable downstairs. RS232 cable can legitimately be run for several hundred feet. This would solve having to go upstairs. You could just plug the thing into the laptop wherever it was in your house when you needed it. I actually did this when building my data general minicomputer. It was in the basement as it weighed more than I can carry. I had a terminal upstairs to work on it from.

Seriously. Even if you lived in a hanger built for a 747 or even five 747's, you could run a single cable accross that space without violating anyone's specifications. I'd suggest you use good quality shielded wire in real long runs like that, but for 20+ feet I'd hack any old wire I had onto it. Phone wire would work.

Regards,

Jeff

7528. Re: Printer and graphic character set

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-22 07:57:36 UTC
From: Technoid Mutant <technoid@nospam.30below.nospam.com>
Message-ID: <laeN9.27099$C06.9883@news.bellsouth.net>
Source record: 24647

Well, the Atari 825 would print those characters as would the 820? thermal
printer. The 1027 won't as will not the 825.

To print Atari Characters (inverse and control chars) on an Atari computer
you need:

Atari 850 interface, PR: connection, or another interface such as the MPP
Microprint interface.

Once you have a workable printerface you will need an Epson FX compatable
printer.

Dot-matrix printers from Epson are best. Anyone's dot-matrix printer will
do though. IBM, Panasonic, Star Micronix, you name it. Almost all of them
have Epson graphics built-in. Few laser printers do so avoid them. Many
Inkjet printers will work in stead of an impact dot matrix, but in this case
you should chose carefully. BTW, I hate epson inkjets. They are the best
for this task but are bad in general.

Configure your printer according to it's manual to be Epson Compatable.

Next, get GHAND.COM. I have it. If you want it, email me and I'll be more
than happy to give it to you.

What GHAND does is create a G: device instead of the original P: device.

So, with everything all configured and working a "List P:" will provide you
with the same crap you've been getting, but a "List "G:"" will give you a
perfectly formed Atascii listing.

I hope this helped.

Regards,

Jeff

Damn. I meant that the 1025 would and the 825 wouldn't. Am I wrong?
Anyway, that is what I meant to post.

The 825 is an 8pin printer and the 1025 is a 9pin printer (much more
standard). I recall printing atascii on the 1025 but the 825 did ascii only.
For sure. I've set a couple on fire. I know.

Hmmm, I got no switch there :-(

> 5) Most Games for the Atari expect you to power the machine off after use.
> I'm not sure what you mean by Ape not working after loading one. Can you
> amplify your trouble report a little?

It doesnï¿½t matter if I turn off/turn on the Atari or make a Reset, APE
just donï¿½t react anymore :-(

> 7) Damn. Where did you get the board and programmed chips for the
> interface? You can also upgrade the memory on the machine. That is mostly
> for ramdisk storage, but why not?

I got several old PeCeï¿½s stored, old XTï¿½s and ATï¿½s ! Most of them
wonï¿½t work any more, so I had a look at the ISA Cards and all the
chips for my Hardware Modï¿½s were there ;-)

> 999) If your 600xl has the 48k upgrade pack jacked onto the back of the

Well, I upgraded my 600XL internally to 64KB ! So is there a way to
upgrade it to more Ram (e.g. 256KB) ???

cheers .... RetroMan (proud owner of an Atari 600XL/64KB/Sio2PC !!!)

Unfortunately, I've already thrown away the packaging. I looked at the RS web site and catalog, but didn't find it. But the RS that I went to had more than one, so the next time I'm close by, I'll check and post it. BTW -- no more catalogs, according to mgr. of our local 'Shack.

Umm, all ataris have that switch. You have one too. I'm sure. Like, you HAVE TO HAVE ONE. It is the LAW.

It should be a recessed thingy in back. You'll need a pen or a paperclip or something to move the switch. Kinda like the drive select switches on an Atari drive except there is only on and it is smaller.

Regards,

Jeff

What about the "Big Blue" thermal printer? I have one of those and with the appropriate ESCape codes, it will print the graphic character set, if I'm not mistaken?

When I first saw this message a number of cool possibilities came to mind.

The 800 is as good as your XL ever was. It won't run everything the XL does, but it is really close.

The 800 has FOUR joystick ports instead of just the two your XL has. This presents possibilities.

With those ports you have eight analog to digital converters and sixteen digitial input/ouput lines. Sounds like a hell of a combination home controller/alarm system/garage door opener/baby monitor/you name it. With those figures I can see an alarm which can sense up to 65536 doors or windows, and up to eight other thingy's which require finer control such as a coffee maker or a barometer or an anemometer, or a thermometer. You getting my drift?

This kind of project would be a lot of fun, teach you to program in basic (presumably), teach you how to solder, teach some hardware/electronics knowlege, be VERY easy to wire up, and be useful til' the Atari dies (which will be never). Remember that fellow that called the 800 a 'tank'? It is.

Regards,

Jeff

Slander is not legal, and your posts are becoming very close (if not
already) slanderous.

Haven't you ever heard of the saying, "Live and let live?" or perhaps
"What goes around comes around?" Keep being a jerk and you'll get what
is coming to you.

I vaguely remember that! LOL I think I saw the name here and there during that era. I think I might have even called it once or twice. If I remember right, you had quite a collection of downloads on your bbs, didn't you?

Yeah, those were the days! Yep, between the emerging internet and people switching to PCs, it sure killed the bbs arena... I guess even in the PC arena too! PC BBSes were really going strong then but I guess they have died out as well since then too.

Happy 8-bitting!

I know the 1025 doesn't because I have one those! :-) But if I remember right, I think that the 1027 might? I could be wrong, though... it's been awhile since I messed with my Atari stuff. I just mess around with my emulator for the moment. Maybe one of these days when I get a house and have a separate room I will set up an Atari once again! Nothing really takes the place of the real thing! :-)

Actually the Atari Trackball and ST mouse aren't serial. They use a simple
scheme to encode switch closures as direction. The Atari Driving Controler
is like that too, but it is a single knob/paddle type controller.

It could probably be sampled with an IBM printer port.

Yeah, Stella is OK... but it does not have full screen mode... or it doesn't for me. So I use PCAE more often than not and I get full screen there and it's pretty cool! If a game doesn't work there, then I try it in Stella and it usually works.

Now that I made a cable for LPTJoy, I can use an Atari-style joystick to play my games either in PCAE or Atari800Win and it's great! I have been wanting to do this for quite some time now since I don't like the Gravis Gamepad. But the one I have been looking at required a resistor or two and I don't know how to identify them or maybe I could have found some around here. So I just put that on the back burner. Then after getting the latest version of Atari800Win, it mentioned this LPTJoy (I think I might have seen it before, though) and it is really simple to put together, especially if you can solder only a little bit like me!. :-) I am not great at soldering but I still managed to get the job done! It only uses 7 wires so you can use any parallel cable and get a 9-pin connector and splice it in at one end.. unless you can find a cable that has a 9-pin on the other end. The only problem is you still have to get the lines in the right order so you would probably have to cut off the 9-pin end and re-wire and splice it back up. You would need a voltmeter or such to do this, though. I used a custom RS232 cable myself that had been used with an MIO. It had connectors on the end that you could just open up and make your changes. Maybe B&C or Best Electronics, etc, has some RS232 cables which could be used to make one of these. Anyways, if you or anyone else is looking to hook up a joystick to their PC, then I recommend this! It's great and easy to hookup and get it running!

Ummm, I think I am talking about the video din plug... not the RF (2-3
channel) switch.

> Well, I upgraded my 600XL internally to 64KB ! So is there a way to
> upgrade it to more Ram (e.g. 256KB) ???

You can do that... or you can do anything else you want to it!! Including adding a din plug so you can connect it to a monitor or TV with a better picture output instead of that crappy RF cable you are using! LOL

Just a note: As far as I know, 600XL is exactly like an 800XL as far as the motherboard goes. There were only a few minor differences between them... 16k instead of the 64k and, of course, which I was reminded of, the video din plug. I think that is it?

So, as far as I know, you can do any mod to it that can be done to an 800XL. As I mentioned before, there are video mods to produce crisper output and there is even an S-Video mod too! Then there is the double Pokey mod so you have 8 channels to play with instead of the 4. And there are several kinds of OS mods like Ominimon/view and others which I can't recall right now but most of these are probably more for a techie kind of person.

Then there is the ram upgrades, ranging from 256k to 4megs (or maybe even more now?). These are for the purpose of acting as ramdisks or data storage for your programs. Unfortunately, they will not give you anymore memory for BASIC than what you currently have. These are usually memory that is added on a separate board and then tied into the main board. They don't replace the ones you put on the main board.

Hope this helps...

Happy 8-bitting!

Let me clarify what has happened here...

He mentioned problems with his video. I mentioned switching over to using a monitor cable then somebody reminded me, though, that the 600XL doesn't have a video (monitor) din plug. However, I think, that one can easily be put in... right? I think that the circuitry is still there... just missing the connector?

I think that would be possible by means of a ramdisk and bank switching. There have been one or more games made based on using ramdisk memory. I have such a game but I don't remember the name of it right off hand.

I can't answer your question on CC65 since I am not a programmer so I will let someone else answer that part for you. If you can get his attention, Tom Hunt would be a person to talk to about this language. If I remember right, he seemed to be pretty heavily involved in it at one time and maybe still is?

Happy 8-bitting!

Where is the official place to get the latest version of CC65? I've seen a couple different flavors of it floating around, but I wasn't sure if there is one that is considered THE one to use...

Thanks

Methinks you've lowered the level of those who are brain damaged, not to mention ben down quite a bit. It's more like likely that Sinplop's self inportance is a figment of his demented imagination. As for sinplop being a computer? if he is, they left out the spelling checker (Hukt on fonix werkt for sinplop). Theres several late night 7-11 clerks who can attest that sinplop is indeed human (only just) albeit one who's both malodourous and bizarre. Perhaps we should just go back to laughing at his pitiful attempts at trolling until the psychiatrist finally gets the diagnosis right and sets him up with the correct dosage.

7557. Atari 800 memory upgrade compatible with XESoftware?

Re: Turbo Power without getting Burned!

***** PRESS RELEASE *****

There have been many mentions in the almost decade since the original
Atari 400/800 Personal Computers hit the dealers shelves about there
being a future upgrade to meet the user's needs, and new and more
challenging applications. Finally that upgrade is available.......
The Turbo-816 by DataQue, for the Atari 400/800/XL/XE.

DataQue Software is pleased to announce a powerful new upgrade which
was co-designed by Ron Shue, and Chuck Steinman. This upgrade will
be available in two forms. There will be a replacement CPU board for
the original 400/800 Computer system, and a plug in module for the
XL/XE series. In either case, there usually is no need for any
modifications to the existing hardware. The only exception to this
is with XL/XE systems which have their CPU soldered in place, which
will require the removal of the existing CPU, and the addition of
a standard 40 pin I.C. socket is suggested. Also included is the
Turbo-OS, by DataQue for use with the Turbo-816 CPU boards.

The Turbo-816 will not only increase the potential speed of the
computer, but also break the 64k memory barrier of the existing
systems. Not with the awkward paged memory, but with a fully linear
decoded address space of up to 16 megabytes. Benchmarks have put the
Turbo-816 into a performance range ABOVE many of the 'other" PCs/!!
Special memory boards will be available to take advantage of the new
extended addressing range. These will be mounted internal to the
computer cabinet, and in most cases require no hardware modifications.

And here is the amazing feature..... While adding all this power and all this expanded addressing, the Turbo-816 for the Atari 8-bit computer systems will maintain compatibility with most currently available commercial and user written software. Using the Turbo-816 even those older programs will enjoy a speed increase!

The Turbo-OS is a replacement operating system for use with the Turbo-CPU which will release the 16-bit processor to its full power. Increased speed will be the most obvious change, but hidden in its code, will be an advanced new floating point library that will speed even the original Atari BASIC to new levels of performance. Again, on most systems it will be just a matter of replacing the existing ROM(s) with the Turbo-OS.

The future holds many more products for the Turbo-816 systems including:

1) a real-time multi-tasking operating system kernal
2) a new assembler-editor-debugger package which supports the new assembly level instructions and addressing modes
3) a new BASIC which will speed past the fastest of the current BASICs for the 8-bit machines
4) a new K&R compatible C development package
5) a new Turbo-GOS operating system (graphical based)
6) a developers development kit for new applications

The NEW Atari Turbo-816 should be available by November of 1988
For more information contact your local Atari Dealer or, write:

Howdy *.*!

Since there is a new version of CC65 I'm getting more curious, because the people working on this project are quite busy. In fact, this are good news to me, and it's time to have a look on this programming package. I watched the portable tetris clone converted by carsten and it's not very impressive to me.

now my question: is it possible to do more atari specific things through C - style programming, without being too near to machine coding? what's about all those technical stuff e.g. dli, vbi and so on?

General, is it possible to write more complex stuff like games, demos or applications with cc65?

also what's about allocating the extended memory above the 64kB border?

Thanks. Does anyone have any working graphics samples for Atari? The current author seems to be fairly geared towards Commodore programs, and I could only build text samples for Atari.

Slor

IMO it depends on the application. If you were to write a RPG for instance,
the file handling and data structures of C would be a better choice then
BASIC or ASM.

I seem to recall there was a mistake in the documentation. Something like
pin 21 is labled pin 23 or something so be careful looking it over.

Other then that it worked well for a few projects I did. I never built the
programmer and another foggy memory is that may have been for 21V PP
devices. At any rate 21V devices are hard to find so if it does specify I
would switch to 12.5V devices.

I don't think you will find anything like that. I have 64K in my Atari 800, so it is the same amount of memory as your average 800 XL or 65 XE, but the configuration of the RAM is different I believe, ie. on the later models it is "the RAM under the ROM."

To me it never seemed like they made any great technical advances with the later models. They had more memory standard, yes, but the processor speed was the same and the graphics weren't much better, and there was still no true 80 column mode.

Now if they had gone for a modular design concept, like Jeri Elsworth is working on right now with the Commodore One, that would have been a remarkable advance.

I'm pretty sure you have to use a real Atari drive connected to a PC using a SIO2PC (or a variety of) and software to transfer the disk content to the PC.

Fortunately you're wrong. This question is addressed in the FAQ:

http://www.faqs.org/faqs/atari-8-bit/faq/section-59.html

In brief, there are about half a dozen programs available that'll do the
job for at least some disk formats. The easiest to read are 180KB (double
density) disks. 90KB (single density) disks can also be read. I don't know
of any way to extract data from "enhanced" density disks (as created by
the 1050 disk drive, for instance).

Of course, for any of these utilities to work you need a 5.25-inch floppy
drive for the PC. Reading should work with either 360KB or 1.2MB drives,
but writing from a 1.2MB drive is iffy.

Of course, this is also the way assembly/machine language is, which is really
the best way to program CPU's like the 6502.

> etc, in it??

I really don't think this is true. The hottest selling games are those like
The Sims that have no violence at all. A lot of the other popular games are
3D platformers like Star Fox that make up the bulk of sales on the consoles.
I would be very surprised if the really gory games even added up to 10% of
the total computer & videogame sales worldwide.

In any case, I don't really worry about violence in videogames as most people
know it's not real anyhow. I like the first/third-person shooters as much as
I like strategy, role-playing, and simulations. It's all about open-ended
gameplay; GTA3 succeeds because it is open-ended, not because of the
violence.

> digitial input/ouput lines.

Has anyone ever built a NiMH charger out of an Atari? I thought about doing this a few months ago and am now thinking about doing it again since the charger I bought doesn't sense battery fullness very well. Of course an external PS would be needed to do the actual charging but I was thinking the joystick ports could be used to control and sense when the battery is fully charged. However, by default the A/D converters can only be read 60 times a second and I don't know if this is fast enough to detect the spike in voltage when a battery reaches full charge. (Most commercial and kit chargers use 4 Mhz microcontrollers w/ A/D converters built in.) I vaguely remember there being a "fast charge mode" in Pokey that would cause the A/D capacitors charge at a faster rate and therefore get a faster sampling rate but it's all very foggy right now.

Well I think a graphics library for atari is still on the todo list.
They think about an "bgi-like" portable, platform independet driver.
But this isn't really usefull, because it would'nt unleash the full
power of the atari custom chips.

Thomas Havemeister <twh1@gmx.de>:

>now my question: is it possible to do more atari specific things
>through C - style programming, without being too near to machine
>coding? what's about all those technical stuff e.g. dli, vbi and so
>on?

Yes, it is possible to do Atari specific things with cc65 quite easily.
You can mix asm with c functions so you could write the vbi and dli
routines in asm and link that to your c program.

For utilities where speed and memory usage isn't critical, programming in C
would be much easier and faster than in pure asm. You can always hand
optimize the code that cc65 produces to get more speed or space out of a
critical routine after the program is working.

>General, is it possible to write more complex stuff like games, demos
>or applications with cc65?

I think it would be possible to write complex stuff with a combination of C
and asm functions. Your game logic could probably be in C, and your
graphics routines, VBI and DLIs in hand-crafted assembly, I imagine.

>also what's about allocating the extended memory above the 64kB
>border?

That is also very easy with cc65. I've written a few little routines to
swap in the extra memory for storage space. The cc65 guys are working on a
cross platfrom extended memory API right now, but I don't think there is an
implementation for the Atari yet. The same issues exist with cc65 as with
any program that accesses extended memory: no interrupts in the extended
memory space or turn them off, you have to watch that your code or data is
not swapped out, etc...

As for graphics routines, there is also a BGI-like API being worked on, but
I don't think anyone has stepped up to the plate to tackle the Atari
implementation yet. I've been working on and off on my own graphics
routines that would only be applicable to the Atari generally.

Did I mention it is fun programming for the old Atari, and that the guys
over at cc65 mailing list are very helpful? What more do you want? ;)

Unfortunately, Dominik is _right_. 10502PC would be the only choice and
the OP clearly states he has no Atari drives. So it can't be done.

The utilities referred to might have worked on an a Pre-XT computer, but
they do not work at all on anything one also uses for the internet for an
example. MyUtil did work for me once but only using the extended
instructions where one has 2 Atari disks made up before hand with a disk
copy function of DOS - when one dies while reading, you pop in the other
and pray the index hole aligns well enough to continue reading the Atari
file. And that was DD only no SD or ED allowed.

In the end - Dominik is right. The OP simply needs to send the disks off
to a working Atari system owner and have the atrs made there.

> instance Basic XE or other XE specific games/software?

They can't due to the 800's joysticks 3 and 4 which the XL/XE used for
internal basic, ram under rom, self-test and extended ram. XE programs
would attempt to work on portb ($D301) which is joysticks 3,4 for 800 - so
no go.

You _might_ be able to make an XE in an 800, but man, what a project!
I'd really have to have an answer to why? And wouldn't it be easier to
just use an XE?

->The utilities referred to might have worked on an a Pre-XT computer,
->but they do not work at all on anything one also uses for the
->internet for an example.

That seems too harsh. Based on the many postings about it on this
base, "My Util" was still the rage well into the mid-1990s. It
probably fell out of popularity mainly because 5.25-inch floppies
disappeared.

->MyUtil did work for me once but only using the extended instructions
->where one has 2 Atari disks made up before hand with a disk copy
->function of DOS - when one dies while reading, you pop in the other
->and pray the index hole aligns well enough to continue reading the
->Atari >file.

What extended instructions? The only extended instructions I ever
saw for "My Util" were the ones I wrote and I certainly didn't say
any of that stuff. (And why two disks? Why not five? Or ten? Then
you'd have the tenth one in case the ninth one died, and the ninth
one in case the eighth died, etc., etc.?!?)

In my experience, the key thing about using "My Util" was to have
"clean" copies, sectorwise. That is, compressed files in consecutive
sectors, rather than jaggedly placed all over the disk. "My Util"
wasn't very good at handling adversity, but it was worse with ragged
files. The value to having an extra blank disk and a copy of a DOS
program handy was that you could quickly recopy onto a fresh disk the
files that "My Util" had failed to read on the first try. ("Fresh"
here meaning formatted with nothing on it, so that newly copied files
would be written on consecutive sectors.) That way you wouldn't
waste time and effort on those files already successfully read.

And that was DD only no SD or ED allowed.

InDeeD!

Memory is not why an 800 is different from an XE. Its mostly changes in the OS that makes the difference. That and a little hardware makes the 1% difference.

Basic XE will run on an 800 if no extended functions are used. But Basic XL would be better..it has 'find' built in.:)

>

The usual process is ...Boot (emulator) to BASIC prompt. 'LOAD"
D:filename.bas,
then "LIST" D:filename.lst. The file then has to be translated ATASCII
to ASCII, utilities are on the net.

Then the file has to be copied out from the emulator to a PC file.
Translation can be done here if a utility can be found.

Nite Hacker:

You need drivers for the onboard USB hardware, USB slot cards, USB adapters, and devices plugged into the USB ports or adapters.

Windows XP has most of these available when it is installed(but they are not installed or active till needed). Same for MAC 10.x OS.

For anything else (almost), the supplied dirver disk has the drivers needed to use the USB device/adapter/card.

I copy these drivers/files/utilities onto small CDs so I have them if I need them when I go away from my main computer.

Hi all,

Does the CV disable switch go across L12 or L13 solder pads on a
600XL?

In AC Dec 93', the article says across L13, but a online document
(looks like it was scanned from AC) says L12...

I also noticed there is a part left off the parts picture in AC...

L12 looks like it connects to one of the 5 pin DIN solder pads...

Help!?!

Harsh?
Anadisk flat out does not work on SD or ED. Therefore no need for
Deana,
the only program that does work kinda is MyUtil whether you call
PCXFer or
whatever, and it only works on DD and very poorly at that. Slor still
can not use it because he needs duplicates of the Atari disks that he
has
but he has no Atari drives to make them with.
For me, MyUtil fell out of popularity as soon as I had
a Happy drive with its IBM to Atari software which did not require
duplicated Atari disks. Happy method fell out of favor when I
stumbled
upon Ataridsk by Hias. But Ataridsk must format all Atari disks used
for
transfer so again, no go for Slor.

What disappeared? I have buckets of them, don't you? Don't tell me
you
just tossed yours with the computer? I can see where a current Atari
newbie might have missed the boat as far as 360k 5 1/4" drives go, but
I'm not going to cut anyone else any slack at all.

http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&th=e404baefb3b65aff&rnum=1
These extended instructions...Myutil only comes with switch guide and
no
nothing about second identical, sector for sector copy of Atari disk
wanted
to be read - that's a big, big deal and the key to getting an Atari
disk
read in the first place. Make as many as you want but I'll guarantee
you
that one won't be enough - where with any luck at all two will do it.
I
speak from experiance, you don't seem to have used it like this at
all? Perhaps, you never tried it with one disk and one very large
arced file
to transfer? For those large transfers its a horrible experiance and
nothing like the quality software, one shot deal Ataridsk is.

> And that was DD only no SD or ED allowed.
>
> InDeeD!
Another point to getting MyUtil to work would be to try to format the
disks
used with MyUtil first - then we get to bypass the index hole issue
and
working with it becomes relatively easy compared to the Atari
formatted
disks and the required 2nd copy of same. But again this can't be done
by OP
so these IBM to Atari methods just won't work for him.

As far as the 'rage' of MyUtil in this group - don't believe
everything you
read on Usenet. Only people that do claim it works is you and a
couple of
Linux users who never post back to the question - HOW?
I couldn't get it work at all for years and then I stumbled upon the
extended instructions on the Pool Too Disk set - I gave it another try
and

it does work, but for me, and without the second Atari disk - NO GO.

7604. Merry Christmas to everybody!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> example.

I can't claim that they all work, but some of them do. I've used AtariDsk
and AnaDisk on a system with an AMD K6 CPU, and I don't see why they
wouldn't work with more modern systems. I had to boot into DOS to do the
job, but that's not a big deal. If nothing else, you could create a DOS
boot floppy just for this purpose. FreeDOS (http://www.freedos.org) will
probably do, but I can't promise that.

As I said in my original post, these tools are most reliable with 180KB
double density disks; AFAIK, only AnaDisk will work with 90KB single
density disks, and I don't know of any tools that'll work with enhanced
density disks.

I just got an 800 mint, unused and I like the keyboard better, plus the way
artifacting is done, untima 3 has the right colors, blue and brown, but on
the XE ultima 3 looks pink and brown... so I prefer use the 800 and woul
have liked to use basic XE and atariwrite xe on the 800 keyboard. You know
how it is :)

LOL

Actually, the whole "Christmas" thing is the Catholic Church coverup of the Druid holiday known as Yule. The trees, presents and lights.. all Yule. Technically, these festivities should have been celebrated on Sunday, which was the Winter Solstice, when Yule is celebrated. Dont forget about the other great coverups such as Haloween which is really Samhaim. The Catholic Church really did a number on the druids, just about wiped them all out. So much for that one commandment, huh? ;)

Merry Christmas!

7622. BASIC program recovery

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-24 18:23:13 UTC
From: David Pochron <dpoch@ticon.net>
Message-ID: <aua8mj$57t$1@galileo.ticon.net>
Source record: 24642

Most of us have experienced Atari BASIC programs that get corrupted on disk or tape, and when you try to load them in you get the dreaded "double READY" prompt after the load (or CLOAD) completes, or the system locks up when you try and list the program.

Has anyone ever written a program (for any platform) that takes these corrupted BASIC files and attempts to convert them back into text so the point of corruption can be fixed and the program then ENTERed and resaved?

I have the BASIC source book, so I could do it myself but it will take a while. If anyone has already written such a utility, it would save me a great deal of time! :-)

Get a clue. XMAS is based on the Roman holiday of Saturnalia!
Which of course, OCCURED AT THE END OF THE YEAR AS WELL!

Hi,

I made such a tool ages ago, converts Atari 8-bit BASIC and Turbo BASIC
tokenized files to ASCII listings. Problem is it runs on the Atari ST.
Probably not exactly what you were after.

Where to get schematic for this? This interfaces an A8 stick to the
PC parallel port?

I remember before too of running across some plans to interface an A8
stick to a PC's game port and the PC would see it as an PC stick of
sorts (granted the analog range of motion would be missing but still).

Theres a blast from the past. Unfortunately from what I remember it wasnt widely available. I suspect part of it was there wasnt much software that took advantage of it so people never bought it and developers never wrote software for the extra cpu power since it hadnt sold in large numbers.

Ultima 3 has a way of switching the artifacting mode depending upon if
you have 800 or XL. I don't remember how to do it (I just barely
remember that you CAN do it) but I could dig it up if it were really
important to someone.

> And that was DD only no SD or ED allowed. <

And that, of course, is the "rub". Nine times out of ten, folks have SD disks to convert. So, unless they have an APE or SIO2PC cable (or) 1050-2-PC or ProSys cable and the associated Atari hardware, they have a problem.

The SD problem (FM encoding) is the disk controller, and the chances of having a modern PC with a disk controller capable of reading SD is really poor. Yes, they do exist, but if you have a FDC built into your motherboard, the odds are somewhere between slim and none.

I have read that Anadisk will read SD Atari disks. I never found that to be the case without one of those uncommon SD-capable controllers. Ditto DEANA (sp?) If someone can do this, I'd love to hear it -- and what PC hardware they are using.

And if you are using UTIL or MyUtil, you need to format your DD disk on the PC side, unless you have an XF-551 or a 3rd party Atari drive that formats using the timing hole.

After reading this thread, I went and pulled out an old circa '93 PS/1 system
and it turns out it is capable of reading SD disks. I also tried using a
modern ABit BE6-II mobo PC and it worked with Anadisk as well, though there
were more read errors than there were with the PS/1. Later this week I plan
to try my VIA KT266A mobo system with the 5.25 drive and see how it fares!
:-)

My BIG problem is with the DD disks - I'm having trouble reading a good lot
of them because of read errors. AtariDisk for DD seems useless - it chokes
on just about any read error and that means no data at all. Does anyone know
of a version of DeAna that works with DD images that AnaDisk creates? Or
perhaps a program that simply dumps a DD disk image to an ATR or XFD file?
Then I could at least run some file recovery software to get back the data
off the image.

This thread got me thinking again, so I "Google'd" into this site. Interesting stuff.
Don't know what the cost of the new products is, but probably more than an SIO2PC cable. :-)

http://www.sydex.com/index.html

Perhaps it is possible to completely bypass the controller functions and "bit-bang" your way through on the PC? (We are way out of my league, now.) If so, that might lead to disk errors which may not be a big deal on text files, but for Atari program files, it likely would be a problem.

Larry

Try WriteATR instead... it will ask you what you want to do when it encounters
any errors.

don't forget that the Easter celebration is timed around the phases of the moon and gets its name from the ancient kingdom of Ishtar. While we're at it, the real reason priests are not allowed to marry is back in the middle ages with people dying all the time, the church was too cheap to provide for a dead priests family, then there is the fish on Fridays thing, which basically came around due to the fact that the Vatican is in Italy, which is surrounded on 3 sides by water, which leads to a bunch of fishermen. Then there is my favorite, rather than have baptisms done on a conscious willing adult as is said in the bible (the whole covenant between God and man thing kinda implies that the one being dunked should know what is going on) we will Baptise babies in order to make parents feel better in the dark ages about all the babies that died since we've already spewed the dogma of unbaptised people going straight to hell and we certainly couldn't say we were wrong about that, so lets make another moronic ritual.

Thanks for the report David, I'd love to hear more success stories with
Anadisk and SD or ED. Ataridsk won't be able to read Atari formated DD
disks. Where MyUtil uses 'repeat on disk error' to allow switching
of Atari disks for continued reading - Ataridsk doesn't. You will have
to format all transfer disks with Ataridsk on the PC first - then and
only then it works like a dream. This problem lies in the index hole
always used by PC drives and never used by 1050s - which also turn at
a different speed than the PC thus insuring that somewhere on every
disk, the index hole isn't right for a PC drive. The 1050 doesn't mind
the different skew or the stretched out sector pattern of the PC
formatted disks, so no troubles reading the PC disk on the modified
1050 other than it's slower to find the sectors.

I'm not too familar with Deana, but I always thought it did just what you
wanted.. With the image file made by Anadisk all you need to do is add
the 16 byte atr header with a hex editor and it is now an atr file.
Hias's WriteAtr program would write out the file and it would
be readable on a modified 1050. MyUtil, Deana and Anadisk are all at
the Umich Archive last I knew, with documentation too. I think the
'extended' instructions I mentioned for MyUtil/PCXfer are in the
PCXFer zip, but I'm not sure, its been too long.

Somebody else answered that saying it didn't.

> Did the ATARI 1025 printed the character graphics set?

I know that one doesn't because I have one of those.

> Did ANY oh the ATARI printers printed the character graphics set?

I thought there was one printer that did? Maybe the 82x, whatever it was...
from just my memory, I would say it was an 825, but I could be wrong and I
am not sure if this printer will print graphics! Hopefully, somebody will
have a more definitive answer for you soon.

As far as I know, or can remember, if you have a graphics printer, such as
an Epson or Star, you should be able to do this. You, of course, would need
an 850 or an MIO, etc, to connect the printer to with a cable designed for
that purpose. Probably can get these easily through B&C, Best Electronics,
etc.

Sorry, I can't help you out with this one very much so I will bow out know.

Happy 8-bitting!

Nite Hacker

From: AtariGuru@hotmail.com
Message-ID: <6f3d294d.0212251228.6ccb2577@posting.google.com>
Source record: 24575

Merry Christmas!

Hey there, I thought I would pass this along to everyone else here.

These are links to the now defunct Holmes site. I don't know whether it is ethical or not, but here it is anyways. As such, there is no guarantees that these links will work now or, if they are working, how long they will work. As noted by Holmes himself, they may not last past Dec 31st and there is no guarantee from him that they will even last that long. Depends on the person or org that is hosting these files, I guess. But, as of now, they are working. So, if you missed the chance before, here is your second, and maybe last, chance to get them now! So hurry and get them before they disappear from this site!

Except for the Utils pages, each of these links will take you straight to the download file but the server is slow and may be difficult to access from time to time so you'll have to be patient! You probably will want to save this message to your desktop so you can easily use the links below. You may have to try 2 or 3 times to get a file... so if it doesn't work the first time, then try again. I could only download 2-3 files per minute. Please try to be reasonable and don't bombard or bog down the site trying to get to these files! Maybe they will last a little longer if everyone stays within reason?

But, again, there is no guarantee that these will work now or for how long they will work. So hurry before time runs out!

Enjoy!!!

The following are a collection of utils even if you are not looking for utils you may want to scan these if you are a gamer. It has some game utils here too, such as cheats, map editors, screen makers, etc.

Note, these are links to an archived page on Google. It dates to a few months back, but they still work. Just click on the link and click on the file you want. Even though there is a menu near the top of each of these pages, it doesn't work so you have to come back here and pick the next page manually. Unfortunately, I do not have a set of the recent pages. So any additions since the end of September won't be found here. But the game archives seem to be complete and are zips of all the game directories of the site at the time of its demise.

Sorry if the links wrap (get broken), just use cut and paste to put it back together again.

Check out http://cth.dtdns.net/atos/ . ATOS made extensive use of the original CC65 by JRD, but had it's core written in assembly. I think it's a good example of what CC65 can produce on the A8. But forget using CC65 by itself for time critical code like DLIs and the like. Those should be in hand crafted assembly.

It is trivial in CC65 to access the A8's graphics through CIO and the extended memory through pointer manipulation of PORTB. The graphics speed would then be limited to the speed of CIO. A better solution for a performance intensive game or application would be to write the core in assembly and then use CC65 to create the outer layer. This lends itself well for speedy application development without taking a hit in performance.

I've implemented an Atari 8-bit version of the Mouse programming language. I call it "Mouse 03" for the year 2003 which is coming up shortly. It's kind of my Christmas gift to old Atari programmers. Retro, but twisted! ;-)

http://cth.dtdns.net/mouse/

I'd appreciate it if you didnt do this.

Do I come into your house, because I know where you hide the key? Okay, not 100% the same, but in a way it is the same.

Although this isnt affecting my server, this does affect the bandwidth of my old space provider, who generously donated space for the archive. He hasnt changed the file locations yet, so yes they do still work, but Please dont use them. The site is gone, get the files elsewhere.

Thanks

Aaron (aka. Holmes)

Hey not that I'm disagreeing with anything you're saying, but you think
there are really that many people looking for those files to make a
significant impact on bandwith? Also, are there any plans to relocate the
files to another server, or will it be dead and gone for all time?

Fair enough asking that. I was going to take a look, but will respect your wishes.

> Do I come into your house, because I know where you hide the key? Okay,
> not 100% the same, but in a way it is the same.
Not 10% the same really. All he did is tell us where the house is. When people then knock on the door you (i.e. the server) say "Yes" and send the files... The unethical point is publishing a private address in a public forum.

Sorry, know I'm being a pedantic git -> pet hate:-)

7669. Re: Printer and graphic character set

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-26 03:45:29 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <tXuO9.6745$b97.716899@newsread2.prod.itd.earthlink.net>
Source record: 24590

Any dot matrix printer with dot addressable capabilities (the Atari 825 was *not* one of them) can generate any image when bit image data is sent. Most Epson and Star models of the mid-80s could do this with the correct software; they did *not* generate the graphic characters from a simple atascii code in the text stream.

There *was* one printer interface which included an operating mode that did generate the characters from atascii codes while using the correct model of Epson, Star, Panasonic, etc. printer. It might have been a 'U-Print'.

have 1 inch of snow. I'm at the north coast, go any
farther and you're in Canada.

7671. Reading Atari disks on PC

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-26 04:17:43 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.51.0212252205260.11654@shell1>
Source record: 24592

On 24 Dec 2002 01:05:35 -0800, "Lee" (melee5) scribbled:
->... you don't seem to have used it [My Util] like this at all?

Oh, I've used it, and often (but not in that way).

->Perhaps, you never tried it with one disk and one very large
->arced file to transfer?

Yup, that's true. I've left all those kinds of disks on the
Atari side. That's what I keep the 8-bit hardware for.

->For those large transfers its a horrible experiance ...

I believe it!

->As far as the 'rage' of MyUtil in this group - don't believe
->everything you read on Usenet.

I didn't just read about it. I *was* here on this NG as far
back as '95 (mainly as a lurker).

->Only people that do claim it works is you and a couple of Linux
->users who never post back to the question - HOW?

In the beginning I was as frustrated with it as you sound like.
All I had to go by was that tiny little "help" file with the syntax.
Eventually I found that the syntax guide had to be used exactly as
it said. Once you figure it out, then it works. (Well, SOMETIMES
it works! When it doesn't get hung up, that is.)

I found that I still have that syntax guide handy. Here it is:

. . . . . .

HELP FILE FOR "UTIL" PROGRAM:

(INVOKED BY EXECUTING THE WORD "UTIL" BY ITSELF UNDER MS-DOS)

Invalid switch: only L/istDir, P/rintFiles, R/eadFiles,
W/riteFiles or I/nitializeDisk
Usage: util /L|/P|/R|/I [/B|/A] [/T80|/P80] [A|B|C|D]: or
util /W [A|B|C|D]: file [file ...]

L = list directory(s) of a MYDOS format diskette
P = print files from a MYDOS format diskette
R = read files from a MYDOS format diskette
I = initialize MYDOS format double density disk
W = write listed files to a MYDOS format diskette

B = transfer data as a binary file (no translation)
A = perform ATASCII to/from ASCII translation (default)

Tn = double sided (ATR8000) diskettes have "n" tracks
Pn = double sided (Percom) diskettes have "n" tracks
Sn = nonstandard diskettes have "n" as the first
sector (usually 0), the default value is 1

. . . . . .

Here are some tips I've distilled from my own notes that I keep
at my computer desk. (This is about the only way to remember how
to correctly use "My Util"!)

(1) On my clone, for example, the 5.25-inch drive is drive 'B'
so that's the drive I put the Atari disk in. Proper syntax for
using "My Util" is:

UTIL /L B: (for directory listing)

UTIL /R B: (for reading the Atari disk)

UTIL /W B: (for writing to the floppy disk)

(2) Unlike the usual DOS syntax, you can't add a filename after
the colon. "My Util" reads the whole disk, not a specific file.

(3) Don't use the /B switch for text files; use /A. /A is an
Atascii to Ascii translator, but it doesn't remove characters below
Ascii value 33. I wrote my own Atari-to-Ascii (ATR2ASC) utility
for removing Atascii characters below 33 from Atariwriter files and
inserting Ascii end-of-line characters to keep line length at 79
or less. I run Atari text files thru this utility before I use
"My Util" on them.

(4) I found that "My Util" works best on small files. 35 DD
sectors seems to be about the limit. (That tallies with what
you said about huge disk-length files.) Perhaps the only way to
get "My Util" to handle such huge files is to break them down
into smaller pieces. (I also wrote a utility that did that. I
believe I've posted both these utilities on this NG in past
years.)

(5) Ignore the reference to MyDos. Any true DD disk is okay,
tho disks formatted on an SF-551 probably work best.

Well, that's the whole point of the discussion, I think... can the atascii set be printed? And you, along with a few others here, have confirmed that the answer is yes... with proper hardware, printer and software.

Thanks so much for your clarification and answers. I am sure this should now be the answer(s) he is looking for!

Happy 8-bitting!

Nite Hacker

I know, I was just making a point as quickly as I could, and was tired at
the time :-)

If it was my server, fine, but as it isnt, I have notified my old webspace
provider, and hopefully, he'll either host the files for everyone to gain
access to, or change their locations, to advoid the 'archived' weblinks from
working.

The majority of the files ARE locatable on other websites. So no real need
to be going in the back door :-)

Thanks guys for the cooperation. James, my webspace provider, may wish to
jump in here and ok it? Up to him from now on, I wont comment on this
again.

Aaron

OK guys

Thanks for the replies so far.
I started this topic because I own a 1020 Atari printer,
and since it is a graphical (not impact) printer, I
guessed it *could* print the complete ATASCII set.

But until now the answer seems to be "NO". :(

This derived me to the question: Did *any* of the Atari printers
print the complete ATASCII set?

I guess that the 822 could print those, but I am not quite sure.
I think that someone who owns that printer could answer this question.

I am very intrigued because I own some local Atari publications that
has some BASIC listings with some graphic characters in it, but
after your explanations I am quite sure they printed those listings
on printers other than Atari, maybe an Epson or something like that.

Anyway, thanks again!

Regards.

BTW, I own a Seikosha impact printer with an Atari-Seikosha interface cable too.
Could this thing print the friggin characters? :)

Isn't it supposed to be summer time in the southern hemisphere?
Ok now that I think about it, you're saying 25 degrees celius, which
is quite warm. I can't stand how us Americans still use that legacy
English system. How can we be so stupid not to standardize? I blame
it on the ignorance of 99% of the population who would be too
confused to switch. Anyways, it was a nice sunny Xmas in Phoenix
this year. About 60 degrees F, around 16 degrees C

Hi,

I already seen many people on the server GREAT!

Some people seem to have problems. I have seen some in the past when
internet explorer was used.

I prefer a program like LEECHFTP. It's for Windows and it's small and also
completly FREE.

http://stud.fh-heilbronn.de/~jdebis/leechftp/downloads.html

I use this all the time.

For people that still have problems contact me.

Not sure about the exact history of the 1020 but I believe a version of it
was sold by Radio Shack for use with their computer. The 1020 like many
other Atari printers seem to have undergone the cheapest path of
modification to run on an Atari rather then be fully compatible.
> This derived me to the question: Did *any* of the Atari printers
> print the complete ATASCII set?

AFAIK the only way to get ATASCII on a printer is with a replacement P:
handler. What they do is look for anything not ASCII, switch the printer
into a bit mapped mode and dump the character.

Then I and a lot of 8bit fans owe you and Anthony a big
THANK YOU
for pounding out those help files that made working
with MyUtil/PCXFer/? a productive experiance at least
even if it had a sharp learning curve at times.

It seems we are in agreement then?
MyUtil will work reading Atari DD disks - but one must
use at least two copies of the Atari disk if the file
to be copied is large.
MyUtil will copy small files on
Atari formatted disks but its still a crap shoot,
sometimes yes, sometimes no.
Its always best to format disks with the PC program on
the PC first - then you have no such troubles as above.

Once I religiously followed the above limits, I had no
further 'troubles' with MyUtil and used it for about a
year like that until I lucked onto a Happy drive.

Thanks again.

It doesn't appear to be possible to bit bang the controller as the FM
mode pins are not connected anymore, starting at about the XT line it
appears. FM is available for tape backup drives but not for floppy
drives - perhaps one could get it back by hacking on their PC mobos,
but I haven't gone there as yet.

Then there is this
Catweasle Floppy disk board
http://members.tripod.com/~apd2/catweasl.htm
but progress is slow to none as I see nothing new in over a year.

I still have hope, but its fading to a mobo hack to get those FM
pins on the controller set to FM mode - trouble is I don't know if
those pins are even connected on the inside of the controller chip
where they would come on out to where we can influence them with a
switch and a couple of resistors?

That would be the Radio Shack CGP-115 color graphic plotter/printer.
I have one of these, but I don't have a 1020 so I wouldn't be able to give
any differences except that I know they used the same type of pen which is
still available for order from the Shack.

First of all, let me say that I am sorry for posting the previous message and sorry if I stepped on your toes. Yes, I really shouldn't have done it. I tossed and turned about doing it for awhile and then finally decided it would not really hurt that much to post it and, keeping others in mind, it would give others a second chance to get what they wanted before it was too late. But since you are or going to make arrangements, this was not necessary to post, and I admit, ethically, it was wrong so I am sorry. Besides, I *only* posted the links here. I did not post them in any other newsgroup nor did I post or plan to post them on any kind of website! As I said, I was doing this as a consideration to others. I did not mean it as a dig to anyone or to be malicous. If you go back and read my post again, you will see that I make this following statement... 'Please try to be reasonable and don't bombard or bog down the site trying to get to these files! Maybe they will last a little longer if everyone stays within reason?' So now do you see that I really did not mean this to be an attack against you or that site?

I, myself, was in the middle of trying to get the game file archives when your site suddenly closed... before the date that was specified, although I know you said there was no guarantee that it would remain open til that date. I was a bit upset that I did not get to finish getting the game archives, at least, and maybe more utils that you have which are really scarce! 8-bit repositories are getting real scarce now and, especially, to lose one like yours is a *BIG* blow to the 8-bit community! I hope you are serious about working with someone to try and keep your collection going on somehow. You are sitting on a *Gold Mine* of stuff which probably cannot be found anywhere else. If this disappears, so does part of the 8-bit community! We *need* your help to keep this a part of our 8-bit community!

Second of all, not to be mean or disrespectful, but you did not hide your 'keys' very well! The keys were in plain view. I just shined the light on them... that's all! I did not steal them... they could have been found even without my help just as easily as I found the keys myself and it takes no time at all to find them. There were 2 main and obvious methods used to come up with the links the way I did. 1) The site's address was *blantently* obvious! The address was either in the download dialog box, the internet history, or even your website... there were no cover-ups or methods to try to mask the site where the files were coming from. 2) Web Archives of past web pages, in this case, Google, which still had direct links to the files. So anyone could have and still can find these!

All too often, I seen this scenario unfold in the past... a site closes, a bbs shuts down, a user group disbands, a company goes out of business, etc, and then somebody promises that they will try to make their software available on CD for distribution or someone else buys it and says they will distribute it, but then nothing happens! I hope that what you said so far, that you really mean it and that you won't leave us in a lurch like most everyone else in the past has done!! If I was in the position to, I would try to make some kind of arrangement to get the collection you have, but I am not in a position to do so. So, since I can't make an offer right now, I hope that you can make an arrangement with someone who really has the desire to carry your collection on and won't leave it in the dust like most people have done in the past!

I am really not here to cause or stir up any trouble. I try to respect other people and I hope they will do the same to me. I have the same goal as most everyone else here... to keep the 8-bit going! But that is getting more and more difficult to do since sites are closing left and right and the software is quickly disappearing and then you run into people that don't really care anymore and don't care what their actions does to the 8-bit community... usually dealing a blow to us and leaving us high and dry in the process and makes us say 'What's the use?' or want to give up too.

So, I hope you see that I have some pretty valid concerns here and that I was doing this out of concern for others in the 8-bit community and did not really mean this to be malicous in any way!

Where are you at Russ (if you don't mind me asking)? I'm in Akron, OH
- had about 7 inches dumped on our place on Christmas eve. Still have
a decent collection of Atari stuff ranging from Touch Me and Stunt
Cycle era games up to the 130XE. Never was fortunate enough to get
into the 16/32 bit stuff.

7695. Atari serial bus cables -- any value

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-27 04:11:23 UTC
From: chuck_kramer@yahoo.com
Message-ID: <2b51fe9a.0212262011.1278fe38@posting.google.com>
Source record: 24515

I've listed a pair of these on eBay but don't seem to be getting any
traffic on them Is there really any value in a pair of these cables?

I was an avid Atari enthusiast for years until spare time disappeared.
Got rid of my 400 and 800 rigs about two years ago. These cables
surfaced when I was cleaning out a file cabinet.

IMO among other things that happened is American TV had a blowout sale of
cables when they left the Atari market. They were selling them for something
like 10 for $10 and a lot of people stocked up.

That and as equipment wears out or breaks the cables are what is left over.

7697. Re: Super Video XL 2.1 600XL question

Well folks,

I was able to upgrade the 600XL with the Super Video XL 2.1 upgrade.

It took a little time, but the results was well worth it...

There were some errors on the parts placement, but I was able to
figure it out.

I then tried one of the 600xl memory upgrades 16k->64k - it didnt work
on first try, so will try some fresh eyes in the morning. The machine
would boot, but random characters would appear when i typed. Going to
look over my connections and try different ram chips...

Message-ID: <nwSO9.3442$j94.638759@news02.tsnz.net>
Source record: 24518

Dont worry about it dude, no probs, I just prefer people didnt do this, I know you didnt make the 'web archives' that allow the linking to happen, and yes I did know people could do this, I was just hoping no one would. :-) I was also tired when I replied the first time, thus a little blunt, and out of line. :-)

For sure I had a nice archive, but please note, that quite a few people worked with me to get copies of everything, both downloaded and on CDrom, so that they can share it to everyone else. So even if I dont manage to come through with uploading it somewhere, please note that at least 30 people have a 'complete' or near complete copy of my site. And these are just the ones that worked with me, how many leeched everything from it anonymously? Heaps!!

So do not worry that anything is gonna get lost. It aint going to happen.

Plus I will always be around, unless I walk under a bus! ;-) So any files you need just request em. (But only if no one else has 'em) >:-) No CD's requests please.

Anyway, give those 8bits a rest, and spend some time with your family's!! The Atari will still be there when you get back.

Speaking of which, and just out of curiosity, is there any source for
those Atari serial connectors other than the existing supply of cables?
That is, are they a standard-but-obscure part, or was this an Atari-only
part that's now no longer manufactured?

> Where to get schematic for this? This interfaces an A8 stick to the
> PC parallel port?

There are many different interfaces out there, but this is the easiest one to build... but, unfortunately, you can only use a joystick with it... no paddles. There are other ones that will allow you to use multiple joysticks, paddles and maybe the driving ones too or use the keypads, etc. You can find these by searching the internet, of course.

Well, as I mentioned before, the latest version of Atari800Win Plus has the diagram to build the joystick interface that I mentioned. Maybe previous versions had it to? Anyways, if you use this emulator, then just start it up and press F1 and when the help box comes up, scroll down towards the bottom to the section called FAQ and glossary. Click on that and it will show you the diagram on how to build this interface, but I think you still need the driver for it, though? Anyways, here is an english version of the original site...

http://www.volny.cz/sumbera/lpt_joy.html

The main site is in Czech, I guess, since it has cz in it's address. But just in case you need it...

From: Dominik <zdominik@netzero.nospam>
Message-ID: <CDydnTWDWs7bb5GjXTWcpA@comcast.com>
Source record: 24525

My first question has to do with CAS images. I think I asked this before and could not get a definite answer. Has anyone been able to boot a CAS (cassette) image file to a real Atari using the APE or SIO2PC software. I could never get this to work although the APE website says it should be done just like booting from a real cassette deck. I hold down Start+Option on power up and hit Return and start the playback on APE. When the tape gets to the first tone it comes up with a BOOT ERROR. Can this be done at all?

Second - how can I get past the first screen is "The Goonies"? The game is driving me crazy! Does anybody know?

Thanks for any advice.

Dominik

7709. Holmes on CD

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-28 11:01:56 UTC
From: Wef Dinaini <appmhi@duh.net>
Message-ID: <XufP9.300510$I6.28827031@zwoll1.home.nl>
Source record: 24530

Hi all,

this is just to notify everyone that the Holmes Archive is available: on CD!

As soon as I found out that Holmes was taking down the Atari archive I contacted him to see if we could make a deal. Luckily for me, and maybe some of you, we did.

I now have here 10 CD's, made by Aaron himself [waves], with the complete archive on them:

1x Atari Programs v1.6 (Games, demo's, ROMs etc)
1x Programs 2.6 (Emulators, Programming tools, music etc.)
1x Atari Pictures
1x Multimedia 1.5
1x Consoles 1.5 (Emu's & ROMs)
1x Atari PD
4x DOCs

I don't have any indexes or TOCs yet, but will post them in the next few days.

I'm lloking into doing various things with them, none of which I will make any money on, so anything I do for any other enthousiasts will be strictly non-profit, just as Aaron and I agreed.

So there are now various possibilities. I could sell complete sets (at cost) to individuals, send someone with a few gigs of ftp space a copy,mail requested stuff to people who ask for it; you name it. Any additional ideas are welcomed, of course.

Alas, I don't have enough space on ftp or other servers to make it available online myself, but if anyone else has, please contact me.

Mind you, specifics are not yet known, I'm just musing a bit. Feel free to provide your input, however, but preferably to the group, as I'd like to keep the discussion (if any) public.

Requests for specific ROMs, games, utilities or whatever can be made via the address below, in case you can't find it via XLSearch.

Kind regards,
Wef Dinaini

To avoid the wrapping you can strip out the &category=????. Thus giving you
a link that fits on one line:

e.g.
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1948321882

From: TXG <txg01@xs4all.nl>
Message-ID: <3e0dca66$0$136$e4fe514c@news.xs4all.nl>
Source record: 24538

Hi,

Just made over 15Gb free space on my FTP server so you can put the files
there. Maybe upload them as ISO or few big RAR compressed files.

host: atari.xs4all.nl
port: 21
user: atari8
pass: atari4ever

Use the upload directory for the filez..

> Second - how can I get past the first screen is "The Goonies"? The game is
> driving me crazy! Does anybody know?
Most screens require cooperation of the two players. Move the chair over
and use it to get a player to the top to activate the money machine to
distract
the person. The other player can then knock over the water drinker thing to
open a hole to the bottom and get down there. With timing, then the other
person can make it. This is all from memory so don't guarantee this 100%.

Hello All,

Just added another 2 auctions as follows:

7 issues of the UK Atari mag '8:16':

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1948496754

4 issues of Current Notes:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1948497319

Be sure to click to see my other auctions too. I've still got lots of other
Atari 8-bit stuff up for auction.

Dean Garraghty

I built something like that! I didn't use anyone's plans, though - just took
a 7404 and 74139 with 10 resistors, 6 diodes and a female Atari gameport and
male PC gameport. Works nice, except a lot of PC games need 2 fire buttons
which most Atari joysticks don't have, or they wire both buttons together.
:-(

Hi Wef,
I would definitly like to get the 4 CD's that are labeled DOC. If these can be uploaded to an ftp site or shipped at your non profit price. I would be interested in helping burn any CD's you wanted to ship to fellow Atarian's.. The Mame rom CD's were done this way also, for just the cost of shipping and CD Burning. The Mame CD's could not be shipped with any included Emulator or player. They were strictly Roms, Atr's of Commercial Disks I would not be able to do unless a release from the copyright holder is available to put on the CD's also.

Regards, and keep us posted.
RoyE

Message-ID: <ZIBP9.443$mg4.122962@zwoll1.home.nl>
Source record: 24453

Hi,

as a matter of principle I don't concern myself with what's on the CD's, and will not alter their contents in any way. Browsing through them reveals a lot of copyrighted, but very 'dead' software which isn't gonna generate revenue for whatever company one'd care to mention.

I firmly believe that distributing the software collection on the disks will not hurt anyone's income. If it turns out to be the case that some items do, I'll violate my own rule and remove these.

In this regard I'd like to point out the message which was on Holmes' site, which essentially said the same thing.

A second thing I'd like to point out is that I will be making no profit from the disks, and that's what anyone will be paying for, adding p&p. You do _not_ pay me for the software and other stuff that's on them. I got it all virtually for free, and any money I'd make on them would be feeding on someone else's efforts. Something I won't consciously do.

Regards,
Wef

Could anyone let me know what the ID of the chip supposed to go in place U9
on the atari 7800 board. I believe it to be a MC14013BCP, but would like to
be sure. It is a Pal board, rev. c, with no expansion slot on the left.

Many thanks,
matt

That's amazing!!!, I've got a random response parser, i fed in this thread
and it came up with the same response, identical down to the punctuation and
spelling mistake, the guy behind sinclap must be using the same random
string generator. I could generate my own sinclap responses.

well you can upload them to tom hunt's ftp server or TXG's ftp server AND sell them on cd for those who don't have the time to download the entire collection. i, myself, would like the cd's but if i can download 'em that'd better / easier on me.

Made special space for ftp about 20Gb, anybody who has something he wants to upload just do it.

When this Holmes cd are for download as 1 big file for me just e-mail me I will download them and put them on the ftp server.

I must say that I am very happy to see that I have continious connection of atari8 users on the ftp server... this means people like it I think....

I am looking to increase the download speed more for users but have to talk to my ISP about that.

I've tried a few of the suggested programs, in pure DOS on a P60 machine,
and so far I have had no luck. I'm told the disk was done on a xf551 in
single density formatted by sparta and copied using the sparta copy command.
If anyone can tell me what program will specifically handle this, I'll try
it!

Slor

For single density you are out of luck. Double density is the minimum. Or you could ask an Atari user to read it with the standard equipment (i.e) Atari 8bit system and double density disk drive . Convert to double density disk.. And then you can read it. An emulator called pcxf380, at this site http://www.emulators.com/download.htm can read with the older p60 pc you have. The required cable is very easy to build -- software and directions for building are included in the download..... all that is needed is a printer cable and an Atari SIO cable and one resistor. Also the manual for running the emulator is very good. You would also need a reliable 8bit (Atari) compatible drive to connect to the cable.

Regards, and best of luck brings back lots of old memories trying to resurrect dead floppies.

AFAIK, the only program for x86 systems that'll read single-density Atari
disks is AnaDisk (available from http://ch.twi.tudelft.nl/~sidney/atari/).
This tool only reads the disk, though; you need DeAna (from the same site)
to create an ATR image. If you can't get that to work, you'll need to use
some other transfer method, such as a real Atari disk drive, special
cable, and appropriate software to access the Atari drive from the PC; or
an Atari drive, Atari computer, special cable, and software to enable the
PC to act like a second Atari drive.

I've just uploaded my archive of Utils and roms to TXG's Ftp. So if you
need em, look there.

I wont be uploading the games at this stage. As I've said before grab them
from other websites! :-)

Thanks to those offering to make copies of my CD's for 'non profit' great
stuff! :-)

Hi all,

Sooner or later, the supply for SIO cable will dwindle to a small
number because people chop them up for SIO2PC/APE cables. I've been
installing SIO/APE interfaces inside my 8 bits for ~2 years now
mounting the 9/25 pin connector on the 8 bit.

Surplus place where I live had Atari Cassettes 2/$5. Included with the cassette was both the serial cord and 9 VAC power supply. I offered to buy them/ship them them at cost to people but no one was interested.

I also saw a vendor with a pallet of 1030 modems sitting out in the rain. Of course no power supply and siingle ended cable. I asked what he was doing with them and he replied "Make me an offer, any offer" but I never did.

I have the feeling a lot of Atari equipment is still floating around just like that. I think we will run out of computers to use the SIO2PC cables before we ever run out of cables.

I had the same problem. I disabled my firewall, unplugged the computer from
the router and connected it to the cable modem. No go. If I had a dialup,
I would have tried that. I finally got the program that TXG recommended
(LeechFTP) and tried that. It worked.

Hi All,

I'm now busy uploading the first CD to the ftp: Atari Programs 1.6. I'll try
to do everything a.s.a.p., time permitting.

It's 8000+ items, and I'm in a 15kbyte upstream, so it could take awhile.

Hello,

Maybe some people couldn't connect 30/12 between 17:00 and 21:00 that was because my ISDN line was being tested. My ADSL did work but my telephone had troubles. Sorry this test was needed because the people from the Telephone company did some tests on the line that could reset the connection.

Problem should be solved now.

Sorry about this ...

>
> --Ken

Wow
Whatever happened to the days where it took you days to beat just one
screen of a game that only had 8 screens to it :)
I remember back in 86 when I got the goonies spending days and days
beating each level and writing up my very first FAQ on how to do it.
Just to be the first on the Philadelphia atari bbs's to do so :)

You are right about beating the first level. The whole game is about
timing and setting up each character to do things in a certain order.
You can just stay put when most of the levels start to check things
out. It's not until the octopus level where you start in the water
being pushed towards your doom that you need to act quick.

Check out my website for more atari memories.

Hi,

Yes me again...

I have made some simple rulez for the FTP server:

1) There is NO download restriction but please upload if you download a lot.

2) PLEASE DON'T LEECH! This will maximum use my upload from my server and makes it harder for other users to connect.

3) Don't upload non Atari related stuff.

4) Don't upload Atari related material that's still being developed, sold or under copyright by active people in the community.

5) Abuse from the Atari8 account means I have to terminate it immediatly.

Sorry about these rulez, but I need to...

Hi for all Atarians that can't connect,

There are a few things that can cause the problems. I checked the server and people are still connecting so it works. What you can do is:

- Try without fire-wall

- Look if you're behind a router (nat translation), try again with a dail-up account to see if it works...

- Use Leechftp I always use it.

I really hope you get it to work.

7774. Millionaire at 31 ... on the Internet! Listen to how he is doing it.

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-31 03:14:15 UTC
From: gregoray.veal3@verizon.net
Message-ID: <af3f95f5.0212301914.7b8ab4b7@posting.google.com>
Source record: 24496

Dear Friend,

I have got to get this off my chest before I EXPLODE...

Stephan Ducharme just became a Millionaire on the Internet … in weeks!!!

He went from 100 hits a day up to 1 MILLION visitors in less than a few weeks … without paying a dime in advertisement !!! … and this just paid him over 1 MILLION DOLLARS !!!

He says anyone can do it with what you are about to learn.

You have never heard of this thing before, Ever!

Let me introduce myself;

My name is Jodi Hans. I've earned $30,000+ in a month, BUT IT'S ALL COME CRASHING DOWN and here's why...

You may have the best program, the best opportunity in the world. The best website.

It doesn't matter. YOU WILL FAIL IF YOU DONT READ THIS.

For months I've been the top affiliate for tons of programs I've been promoting.

In fact, many of the campaigns you've seen promoted, I've been one of the top earners.

Over the past years I learned so much that I even started to coach a team of 16,000+ promoters through my newsletter.

Over the past years, you can imagine that my team and I have read and heard everything that exist about making money on the Internet and creating web traffic.

We had our own forums, chat rooms, we were receiving all the marketing and opportunity newsletters you can find.

But even despite all we knew something was missing, business started declining. (If experts like us are shrinking, what is the chance for a newbie to succeed online? None)

Nothing would do. We would jump into the newest matrix program of the week or we would promote the best selling programs with the best sales letters (and we know what will sell) ... but all we could do was work harder and harder, more and more hours each week to compete with the

ever growing competition.

After asking around us, in forums and newsgroups and chat rooms, it soon became obvious that webmasters are all waiting for something to happen in e-commerce.

As if the Internet is ready for a new challenge. A new pulse. The next generation.

Nothing will do anymore. It's always the same thing coming over and over again.

The Internet gurus just can't put their finger on what would work again.

95% of the money making strategies you purchase today WILL FAIL! The other 5%, well you'd better know how to generate huge traffic, else your dead in the water… and even then, it's not like it used to be, just a few months back.

The Expert Guru's with their vast knowledge and combined experience can not put their finger on what would make it work again.

STEPHAN DUCHARME SUCCEEDED - HE MADE A DISCOVERY THAT WILL AFFECT EACH ONLINE BUSINESS WORLDWIDE, INCLUDING YOURS.

THIS IS HUGE.

THIS BREAKTHROUGH IS YOUR ONLY SOLUTION

My experience has taught me there is no real mystery to earning large sums of money if you understand this one simple thing... ...it's Not What You Know, But Who You Know!

So we began to search ... we didn't know for what at that moment, but one thing was sure, it had to be refreshing, a new age. We prayed for a new vision, not a continuation nor a follower.

My greatest asset is my vast network of online associates.

Several Weeks Ago, the angel of prosperity smiled upon me.

In short, I knew someone who knew someone who discovered a secret.

When I read about it, I was skeptic at first. It seemed too good to be true.

I called the man himself and asked him all the questions I could think about, just to test his knowledge.

Well, after only a few answers, I knew he was different. His answers were not shifty and the way he saw the Internet... well, I had never seen that side.

When he explained to me the method he took to go from total obscurity up to 1 Million Visitors on his website in a matter of WEEKS, I was

knocked out of my chair.

The juicy part was when he had the nerve to insult my intelligence by saying that he was not even paying a dime in advertisement !!!

I knew it was impossible. Well, I thought I knew better.

The fact is that I WAS WRONG folks.

This man sent me his step-by-step map, and in the first 24 hours, I had more than 27,468 new visitors on my site without paying a red cent in advertisement. STEPHAN IS RIGHT!!!

I RECEIVED 84 $197 ORDERS WITHIN 72 HOURS! ....A personal record for me.

PROFITS ARE NOW FLOODING IN from my web site again.

Up till just now, I kept this for myself.

I 'm about to tell you where to download this AMAZING NEW FORMULA and you are going to rake it in faster than you can count.

So HERE'S WHAT HAPPENED...

One evening, I was introduced to a young Canadian gentleman, Stephan Ducharme.

Stephan created the run-away best seller...

"HOW TO GET 1 MILLION VISITORS ON YOUR WEB SITE WITHOUT PAYING A DIME IN ADVERTISEMENT"

When I met Stephan, he had just paid cash for a Porsche and was shopping around for a Jet Airplane.

I really thought I had it going on until I met Stephan.

He's not some rich kid with a silver spoon in his mouth. Just a few years ago, Stephan Ducharme was cleaning carpets for a living.

To make a long story short, he spent more than 10 years and paid over $187,000 of his own money researching everything there is to know about the internet and on making money.

He bottled some of his discoveries into an ebook and within weeks, TEN'S OF THOUSANDS OF VISITOR'S A DAY were flooding to his web site.

Stephan became a millionaire within a few short months... AND THIS WAS JUST THE BEGINNING.

Stephan has just now developed a super simple KILLER FORMULA that is like nothing you've ever seen or heard of before...

Stephan has just finished his long awaited, UP-DATED version THIS WEEK.

A NEW GENERATION 9-STEP FORMULA ANYONE CAN USE TO MAKE A KILLING ON THE INTERNET

Stephan's NEVER BEFORE SEEN 9-Step formula has only been seen and witness in action by one other person besides myself, who wrote back with this perfect 5/5 critic:

"A Masterpiece of an Internet Genius"

...and I agree.

It is set up so that anyone can apply it to MAKE A KILLING ON THE INTERNET within a matter of days.

It will work in the worst of economies, and from anywhere in the world.

TO APPLY IT...

**You Do Not Need A Web Site

**You Do Not Need A Product

**You Do Not Need Knowledge or Experience to earn money with his formula.

You simply apply the easy 9-Steps which comes with the same KILLER Web Site Stephan is now using to generate $1,000's every single day.

It doesn't involve MLM and you do NO PERSONAL SELLING.

Just apply the 9-step formula then set it lose.

NO WORDS CAN EXPLAIN IT UNTIL YOU HEAR IT FOR YOURSELF

I GUARANTEE it's nothing you've ever seen or heard of before.

- Cory Rudl has never heard about it!

- Terry Dean has never heard about it!

- Dan Kennedy has never heard about it!

- Mark Joyner has never heard about it!

It's Completely New!

It's so ahead of it's time that every single online business that does not apply it will crumble without it.

"WHEN I APPLIED JUST ONE PART OF HIS NEVER BEFORE SEEN 9-STEP FORMULA, I RECEIVED 84 $197 ORDERS ON MY WEB SITE WITHIN 72 HOURS!"

AS A TEST DEMONSTRATION, I'M GOING TO REVEAL IT TO YOU - RIGHT HERE, RIGHT NOW FOR FREE!

You can access it by clicking the LIVE LINK at the bottom of this email.

The Link will take you to an audio ebook that is an impromptu interview with the genius himself, Stephan Ducharme.

The Audio eBook is titled...

"MILLIONAIRE AT 31... ON THE INTERNET - LISTEN TO HOW HE'S DOING IT"

By listening to it, you will see how Stephan used his "1 MILLION VISITOR" ebook and his 9-step formula to become a Millionaire virtually overnight.

You will see and hear THE TRUTH about earning $1000's weekly from the internet while everyone else is struggling.

WARNING: YOU ARE NOW GETTING A HIGH SECURITY CLEARANCE!

THE LIVE LINK BELOW WILL AUTOMATICALLY DEACTIVATE 24 HOURS AFTER YOU'VE OPENED THIS EMAIL.

Be one of the very first to get in on this amazing new Formula and Discovery.

If you're ready to listen to a Millionaire speak on what's it's like, how he got there and the amazing new Formula that has made him wealthy...

CLICK THIS LINK NOW:

http://businessworldlist.com/cgi-bin/ads.cgi/gveal_1005

Again, you DO NOT NEED A WEB SITE to make money.

YOU DO NOT NEED A PRODUCT to make money.

YOU DO NOT NEED EXPERIENCE...

You just need to SIT BACK, RELAX AND LISTEN TO THIS AUDIO EBOOK:

"MILLIONAIRE AT 31... ON THE INTERNET - LISTEN TO HOW HE'S DOING IT"

http://businessworldlist.com/cgi-bin/ads.cgi/gveal_1005
The world has changed, a new age has begun. The internet has changed for ever.

Now is your chance to catch the new wave of internet marketing before everyone else does.

Click here and Discover Stephan Ducharme's Secret Formula for yourself and your family

http://businessworldlist.com/cgi-bin/ads.cgi/gveal_1005

I personally recommend it and endorse it 100%, with all my reputation.

Happy listening...

Jodi Hans, CEO

The Wealth Guide

PS. Do yourself a favor. Take the next 20 minutes and listen to a 31 year old millionaire reveal in his own words how he went from 0 to 1 MILLION VISITORS paying him over 1 MILLION DOLLARS in just the past weeks.

The simple 9-Step Formula Stephan Ducharme has discovered can be applied within the next few hours and you can begin earning money by the end of the week.

Here's the link to his amazing audio ebook interview:

http://businessworldlist.com/cgi-bin/ads.cgi/gveal_1005

7777. Percom / Tandon Drive problems

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-31 05:06:27 UTC
From: Rory McMahon <fujiman@netzero.net>
Message-ID: <4g821vk4b1s8iv6pi3btga846cvrotu3ai@4ax.com>
Source record: 24398

Hi all,

I've had two Percom drives in the basement and finally getting around
to test them.

The AT88-S1 works fine.

The one I'm having problems with is a RFD40-S2.

I dont have a manual. Not sure if proper dip shunts are correct, has
terminator on the outside, all 6-7 jumpers on outside, too.
The unit powers up.
Disk heads cleaned.
One mechanism seems to be correct speed ~294 rpm
The other is spinning noticely faster, and adjusting the pot on the
back of the mechanism doesnt change the speed.
Neither drive hooked up singly will boot from a DOS diskette. Could be
a alignment problem. (Any utils available to align heads?)

Thought about:
1.) Swapping AT88S1 floppy mech to see if the controller is working
properly on the RFD unit.
2.) Try to find replacement mechanisms online.
3.) See if anyone has any other ideas...

Thanks in advance

Rory

Hi,

I'm sorry to report that I have some problems uploading at the moment - my
connection is a bit flakey to say the least (between me and you: ik heb
nooit
gedonder met mijn kabelaansluiting, alleen als 't belangrijk is...)

I will continue uploading as soon as I get a bit of reliability back. Maybe
later today.

Kind regards,
Wef

Nooo.. it means that you have to buy the rights to all 8-bit Atari
computers and slap together a new machine using a 65816, the graphics
chip from the 7800, and dual pokeys. In addition, you MUST rewrite
Sparta and Action so they support the '816 flat memory model.

;)

Bill

My AMD-K6 350 running Win-98 has a 5.25" floppy drive that works great with
MyUTIL, and I also use this PC to access the Internet. :)

It depends on your floppy drive, not the vintage of your PC.

If you already downloaded WriteAtr V0.92, please visit my webpage again
and get V0.92a.

I fixed an important bug in V0.92a: in 720k / XF551 mode only 180k were
read and written! This is just the mode you should be using with a
3.5" modified XF551, so writing/reading images larger than 180k will
just fail...

Thanks to Mr.Bacardi (who discovered this bug), I was able to fix it
back in august, but then I think I forgot to upload it to my webpage...

Sorry for any inconvenience & a happy new year (at least in a few
hours here in Salzburg :-) ,

Hias

7787. atari++ 1.11 h-kernel emulation

Newsgroup: comp.sys.atari.8bit
Date: 2002-12-31 17:07:14 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <ausis2gap1@mamenchi.zrz.TU-Berlin.DE>
Source record: 24408

Hi folks, and a Happy New Year!

It's time to announce a major release bump of the atari++ emulator, the 1.11 release is ready now.

Maybe about the most interesting feature is that it includes now a cycle-exact emulation of the
6502 that is synchronized with the GTIA video output, allowing so called "horizontal kernel"
methods to alter GTIA registers within a horizontal line. Or to put this in less technical terms,
atari++ 1.11 is (AFAIK) the first emulator that really emulates now "Master of the Lamps", "Dimension X", "Miner 2049er" and some others correctly by keeping care of the precise instruction
timing and the horizontal position where modifications to chip set registers have been made.

As always, drop me a note. I haven't yet found the time to setup a web page... I prefer working
on the software, ya' know.... (-;

Anyhow, a Happy New Year to all Atari8'bitters,

Thomas Richter

The report that someone posted here looked like his FTP client was trying to
use passive mode. ("PASV") People who are having trouble connecting to this
or other FTP sites should try disabling passive mode if they can, it helps with
lots of FTP sites.

Hi,

Ermm... yes. Should have marked my part as Dutch too. Sorry to
everyone else in the group!

If we work something out I'm sure TXG or I will tell y'all
here !

Regards,
Wef

if i gotta rewrite Sparta & Action so they support the 816 i may as
well add usb & cdrom support. :o)

I've got it, you write a book or talk on a tape, get dumb folks desparate
for riches to buy it. That's 2 steps, where's the other 7. LOL
